It is better to install a Low Pass Filter before you meet
and talk with neighbors about your ham radio.

6 Meter Low Pass Filter Models:
#1 Harmonic down 58 dB
Handles up to 250 watts PEP $39.00
#2 Harmonic down 68 dB through 900 MHz.
Handles up to 2 KW PEP $60.00

*All test were made into 50 ohm load .

Price plus $5.00 shipping & handling Con US.
kb5mer@aol.com

Hi Jess ,Firstly , Happy New Year !
There is an excellent ,although not very recent ,design for a QRP 2m CW/DSB transmitter published in ARRL publication :'Solid State Design for the Radio Amateur , pages197 -200
This is an excellent book really worth its $ 15- price tag.
It'savailable from ARRL and the known ham radio stores ;probably also from Radio Shack .

> --
> John Marlow G1ORP

There's one entitled "World's Smallest 10 GHz ATV Transmitter" [_73_ Magazine, July 1994, pp. 16-22] consisting of a GaAsFET oscillator on a PC board where two stripline patchs act both as antenna and feedback path. It is described as having 7 components and generating 1mW of output, to be used with a dish. A double-sided PC board is available from FAR Circuits if you want to try out this curiosity.

Have a look at the Equipment section of G3YCC's home page (accessible through the links section of my QRP page - URL below). There are comments about the QRP Plus there. It seems that the original unit was a bit of a lemon, but that mods that were done had made it much better, though at a price - as the writer says, he's have been better off to wait and buy the later version.

Other reviews I've seen have been more favourable - maybe they are of the later version.

I'd suggest get hold of QSTs in the late 1960s/early 1970s and look for a crystal controlled AM or FM transmitter. Build this up except for the audio circuits. Put a PNP switching transistor in the PA collector line to handle the keying. Also put a variable capacitor and coil in serise with the crystal to obtain some frequency shift (50kHz or more should be easy).

Rick Campbell KK7B published a cute 2m VXO in QST (May 1993; reprinted in QRP Power) that works extremely well. It's stable, clean and simple. Add a power amplifier (trivial at these power levels) and you're done.

Many of the transistors that are favourites for stuff like this (2N4427, 2N3866, etc.) are no longer available in TO-39 packages, so a bit of ingenuity (or the phone number of a good surplus dealer, or a well stocked junkbox) is called for.

I know you asked for info on a resonator, but there is a nice page on
Helical Antenna design at

http://www.tuc.nrao.edu/~demerson/helixgain/helix.htm

It shows the difference between theoretical gain formulas and actual
measurements.

Maybe there would be something related to your query.

When rebuilding battery packs with nicad or nimh cells, and tabbed cells not available, what is the correct procedure for soldering directly to the cell? Does this harm the cell if done quickly and cleanly?
I have experimented with acid flux, and found that it facilitates soldering to these batteries, in fact it can be done very quickly with the right flux, but I wonder how much damage is being done in the process. Thanks in advance to all who take the time to answer my query.

Tim

14. FS: Teflon Wire #20,22,24,26

20. Errors in ARRL "Understanding Basic Electronics"?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-01 00:00:00 UTC
From: wmeara@erols.com
Message-ID: <34abb5a8.759283@news.erols.com>
Source record: 87914

I posted this over in sci.electronics.basics, but haven't had much response. What do you folks think of this:

I was looking through the ARRL publication "Understanding Basic Electronics" and I've come across what appears to me to be some serious errors in the way transistors are explained. I'm a complete "amateur" at this so there is an excellent chance that I've got it wrong, but let me run this past you to to see what you think:

Page 26-4, In the section on "Solid State Diodes from Semiconductor Materials" The author describes the reverse battery connection this way: "...this time the negative battery terminal connects to the P type semiconductor. The positive terminal connects to the N type material. Remember that like charges repel. THE NEGATIVE BATTERY VOLTAGE REPELS FREE ELECTRONS IN N-TYPE SEMICONDUCTOR MATERIAL AND THE POSITIVE SIDE REPELS HOLES IN P TYPE MATERIAL. MORE ELECTRON HOLE PAIRS COMBINE IN THE DEPLETION REGION, SO IT BECOMES WIDER. There is no current because electrons and holes do not make it all the way through the semiconductor. The depletion region becomes too wide for them to cross."

Is the depletion region getting wider because there are more electron/hole pairs combining in the depletion region, or is it getting wider because majority carriers in both regions are being pulled away from the junction by the battery voltage?

Things get more confusing (for me!) on page 28-2. The text is describing how a JFET works. N Channel, P type material in the gate:

"With a reverse bias voltage on the junction, free electrons in the N-type material move toward the P type material. Holes in the P-type material move into the N-type material. As these Holes and electrons combine, the depletion region increases."

Huh? Reverse bias has a positive voltage on the N-type source and a negative voltage p-type gate on the gate, right? Wouldn't this arrangement cause the free electrons in the N type material to move AWAY from the P type material? And wouldn't this voltage arrangement to cause the holes in the P type material to be pulled back from the junction, AWAY from the N type material?

Any help/advice on this would be much appreciated.

Unfortunately I do not have the publication which you referenced.
Nonetheless, I will attempt to clarify what you have read.

>Page 26-4, In the section on "Solid State Diodes from Semiconductor
>Materials" The author describes the reverse battery connection this
>way: "...this time the negative battery terminal connects to the P
>type semiconductor. The positive terminal connects to the N type

>PAIRS COMBINE IN THE DEPLETION REGION, SO IT BECOMES WIDER. There is
>no current because electrons and holes do not make it all the way
>through the semiconductor. The depletion region becomes too wide for
>them to cross."

Before I get to your question, I have to agree that there is a problem
with what was said above. Everything about what he said seems to be
correct, except the phrase, "MORE ELECTRON HOLE PAIRS COMBINE IN THE
DEPLETION REGION, SO IT BECOMES WIDER."

So far as I am concerned, that statement is not only misleading, it's
probably incorrect. Let me quote from ARRL Handbook, 1994 Edition,
page 4-1. "This leaves the junction region without any carriers:
consequently, there is no conduction." In other words, the reason the
junction does not conduct and the reason that the depletion region
becomes wider is that the holes and electons (the carriers) have all
gone to lunch elsewhere.

>Is the depletion region getting wider because there are more
>electron/hole pairs combining in the depletion region, or is it
>getting wider because majority carriers in both regions are being
>pulled away from the junction by the battery voltage?

Now that I see your question and your suggested explanation, I think
that you have said it as well as I. I.e, your latter explanation is in
agreement with what I quoted above.

>Things get more confusing (for me!) on page 28-2. The text is
>describing how a JFET works. N Channel, P type material in the gate:
>
>
>"With a reverse bias voltage on the junction, free electrons in the
>N-type material move toward the P type material. Holes in the P-type
>material move into the N-type material. As these Holes and electrons
>combine, the depletion region increases."

Again, I believe the text that you are quoting is horsed up. Any reverse biased junction should be explained the way we have said above - it shouldn't matter that its a gate junction in a JFET. One thing that seems to be consistent in all references - the depletion layer that forms widens as the reverse bias is increased. The confusion seems to arise when the author tries to explain the migration of carriers away from the junction.
>
>Huh? Reverse bias has a positive voltage on the N-type source and a
>negative voltage p-type gate on the gate, right? Wouldn't this
>arrangement cause the free electrons in the N type material to move
>AWAY from the P type material? And wouldn't this voltage arrangement
>to cause the holes in the P type material to be pulled back from the
>junction, AWAY from the N type material?

Correct.

My explanations for the two conditions of forward and reverse bias are as follows:

Under conditions of forward bias (positive battery to P material and negative battery to N material) the majority carriers (electrons in the N material and holes in the P material) cross the junction and become minority carriers in the region where they are in the minority. The minority carriers will, in time, recombine with the majority carriers (of opposite polarity) in each region. Under these conditions the charge carriers are relatively unimpeded.

In the reverse bias situation, the holes in the P region and the electrons in the N region are withdrawn away from the junction forming a depletion layer that grows or becomes wider as the reverse bias voltage is increased. It is increasingly difficult for an migration of charge to occur in the region where no carriers exist.

Hi,
We are looking for an ongoing supply of transceivers.

Requirements:

Low Cost
FM
3W or greater
UHF
Single channel operation
Prefer PCB only with access to RX audio,
TX Audio, PTT and RSSI or squelch.

If you know of a company who would supply
these could you please email me.

Source record: 87836

Hi there,

Toko makes helical resonators. They are listed in the digikey catalog, which you can find at www.digikey.com. They ship worldwide. I was thinking of getting one to make a 2m bandpass filter, using a minicircuits ERA amplifier as a pre-amp to make up for the 2.5 db insertion loss. They sell 2 and 3 pole filters, showing a 2 pole with a centre frequency of 138 mhz (which I expect is adjustable), and a 3 pole with a centre freq of 144 mhz, but with 8db insertion loss. Please tell me how you get on.

73s,
Brett VK2TMG

hi there :

I need circuit of hamtronics R144 FM Receiver or helical resonator amplifier .

I need info , how to built helical resonators (3 pole) ?.
I have 2m receiver and I want to make adapt helical resonator .

30. Re: Errors in ARRL "Understanding Basic Electronics"?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-02 00:00:00 UTC
From: wmeara@erols.com
Message-ID: <34ac6d8b.47833303@news.erols.com>
Source record: 87837

Thanks Bob. I've sent my message to the ARRL tech info service.
Its really a shame that this kind of error made it into a book
intended for struggling new hams.

Overall I think the book is pretty good. It is more mathematical in
its orientation that most beginners books. This error gave me a
chuckle - it reminded me that it is possible to have a complete
mastery of the math, yet still not really have the physical processes
completely straight.

31. NN1G 40/30m QRP cw transceiver

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-02 00:00:00 UTC
From: LA8AK@no.dial.tone
Message-ID: <34ac305d.4352202@news.online.no>
Source record: 87838

Hi
I needed a small receiver, and possibly cw transmitter to carry in the rucksack when mountaineering in the summertime. It should preferably be a superheterodyne transceiver, I have used enough of simple 0V1 or DC technique equipment.
some time ago I started the NN1G project for 30m transceiver. I did not use the original vfo, so I built a separate vfo and assumed to RF ouput level to be 0.3V RMS for proper injection level on NE602.
I had some trouble to decide how to mount the board in a way where it was easily serviced/modified as installed. It was found to be a problem that it was several wires to be connected to outside components and connections, jacks and potmeters could better have been installed on the pcb. The pcb is typical "american style" - most readily available components are somewhat too large to fit the holes, while it is very much unused space on the pcb, some normal components are substantially smaller than what the pcb is made for.
I had some problems, and I have not finished the project. mainly because of lack of time, and I need it only for the summer time.

I wonder if some component values stated in the QST article are wrong? The pi-filter between RX-mixer and xtal filter seems to have high attenuation, I cannot see the values are correct.

any comments?

Tim,
I'm not sure about how "correct" it is, but I've done it with the
liquid solder from Radio Shack and a hot soldering gun. Use a file or
sandpaper to get a good surface first, then be quick. This stuff
works at a pretty low temp.

Greetings and Happy 1998...

I looked up the NN1G construction article in the 1995 ARRL Handbook (pages 17.79 through 1783). It indicates the following values for 30 Meters... C22 47 pF.... C5 not used on 30M... L8 22uH epoxy rf choke. I also noted that C9 is not used in the 30Mtr version of this rig.

I hope this helps...

Tim,

Happy 1998...

Rule number 1 in basic soldering class is NEVER USE ACID CORE SOLDER on electronic or electrical devides. Use a good resin core solder, 60/40 lead/tin will do well. For 'C' cells I use a 35 watt soldering pencil. Make it quick and a get good solder flow keeping the actual time the iron is in contact with the battery to a minimum. Been doing it for years flying R/C and no problems so far.

Hi Guys;
I have for SALE:
Homebrew Roller tuner will handle 2kw pep,
uses two large caps and one large roller, plus a balun.
Its already mounted in a rack panel and finished but I advertised PARTS because everyone wants to make thier own.
Anyway there are over $300 worth of parts, waht with the turns counter, vernier drives(2), 2 CAPS, roller, balun, etc.
There are no used old Mil surplus parts in here, all newer stuff.
I can supply a JPG picture of it!
Price is $150 shipped.
Thanks es 73.....RICH RLUCCH2098@aol.com

And like all rules designed for idiots, it's sometimes wrong.

It's perfectly OK to use acid fluxes if that's what works.
There are metals or alloys (e.g. Nichrome, 316 SS) that rosin
flux doesn't work on. You just have to be exceedingly careful
to remove all the flux. Use water followed by anhydrous alcohol.

We use lots of odd wires in my lab, and I've never ever had
problems using acid fluxes. And this is stuff that's very sensitive,
with noise figures of -18 dB (resistors cooled to 4K,
transistors at 25K, wires are various hard to solder superconductors).

Hi Jim.

Spectrum International used to sell KVG filters. They advertize every month in CQ but only other products. I've not found a web site for them. However, their ads give:
PO Box 1084, Dept Q, Concord, MA 01742
Phone 978 263-2145, Fax 978 263-7008

You might also try the web sites for:
Piezo Technology - www.piezotech.com/filter/index.htm
International Radio - www.qth.com/inrad/home.htm
I think the last one used to be Fox-Tango filters.

Hope this helps.

Yes they are still in busuness. The filter for AM would be XFM-9C.
This is a 8 pole monolithic crystal filter with +/- 1.875 Khz
bandwidth. The home page for KVG-GMHb is:

www.oase.de/kvg_gmbh/default.html

They list the US distributor as:

KVG North American Office.
2240 Woolbright Rd
Boynton Beach Fla.
33426-6325

Should check to see if the phone # is correct. They list it as:

407-734-9007 but that area code should be 561 Don't know if the number
is still correct.

Hope that helps

Regards

James

44. Add-on HT CTSS encoder/decoder interfacing questions

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-02 00:00:00 UTC
From: h1riley@umassd.edu
Message-ID: <34ad460d.0@gatekeeper.umassd.edu>
Source record: 87851

I'm looking for a little experienced help with understanding
what might be involved in using a CTSS encoder/decoder designed
for use in a manufacturer's HT by that manufacturer--
in other words, a factory add-on (as opposed to 3rd party add-on).

My objective is to obtain one of these at a flea market or
elsewhere, and use it NOT in the original HT for which it was
intended.

I don't mind driving this with my own microcontroller if necessary,
but I'd like to know if people think it will be possible to obtain
the necessary protocol, bus setup, etc. info in order to drive the
device and program it to different frequencies.

Have already checked with a *big* (nationwide) ham dealer by phone,
and checked one *big* HT manufacturer's web page, but the dealer
phone person hadn't a clue, and the web page mostly has real new
products, and no tech info whatsoever.

There are *more* phone numbers I have to try that are deeper into
service and tech info, but would like to avoid protracted phone calls
and "telephone hold purgatory."

I like to build things, so that explains the interest in doing this.

45. Re: 900 Mhz mod or transverter????

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-02 00:00:00 UTC
From: Ron Curry <recurry@insighttec.com>
Message-ID: <68jmp9egj1@usenet89.supernews.com>
Source record: 87852

Richard,
I have personally modified the following radios for 900mhz ham band:

- Motorola 900mhz Spectra
The mod here is not trivial. Needs VCO stripline mods, preselector mods, and patched software to program. Will tune entire band with these mods. I'm currently using these in a repeater and as mobiles

- Motorola 900mhz Maxtrac
Need conventional firmware. Needs VCO mod but easier than Spectra - won't do ARRL band plan though.(I suppose with the same effort put into the Spectra's it may). Must replace preselector filters. I'm not currently using these.

- Motorola 900mhz MTX900 HT
The mod is easy but developing it took several months. It requires addition of a second microprocessor module with code I developed to allow it to be programmed for ham band. These work great. We are using these with the above Spectra repeater.

- Motorola 900mhz Micor repeater
Preselector filters and mixer filters must be modified to get good RX sensitivity. Otherwise you just need the right xtal's. Keep in mind I'm talking about a commercial repeater here not mobile units.

There is no public info on any of these mods - I developed them myself and haven't documented them well enough for others to implement. I'm thinking about making the processors modules available for the MTX900's though since it just amounts to sniping some pins and soldering wires (you need a steady hand thought) but haven't decided whether to do it or not or the price.

Better to call Communications Specialists, and order one of their
retro-fit PL boards...if you need more than one tone, then you can hook
your micro-controller to the select lines of the board(only 4 switches are
used).
They make encode only, and encode/decode versions.

Its been years ago since I worked with a home built curve tracer. Unfortunately I can't tell exactly how to go about making one though. I can tell you the basic principal is to use a small transformer (6 volt is good) and insert current limiting resistors in series. I think the current limited AC signal is connected to the DUT. X on the scope shows the terminal voltage, while Y shows the voltage drop accross the current limiting resistor (i.e. current signal). The scope is then placed in X-Y mode.

The theory is to apply the current limited AC signal accross the P-N junctions of the Device Under Test (DUT). When the junction biases on, the Y display will show relatively how much current is flowing and in which direction depending on the pattern's deflection.

Perhaps this will give you an idea of how to set one up. Very simple to build and use.

The "no acid" rule for electronics is a myth. There are cases where a mildly acid flux is required to properly wet the joint. I don't advocate using the paste sold at the hardware store for soldering rain gutters, but acid-base fluxes are used all the time. A case in point is Hydro-X 20 from multicore. It is an acidic water-soluble flux intended for electronic use (pcbs, etc.). Kester, Alpha and others make similar products. The main thing is to remove all residue, as it will destroy components if left behind. Just _don't_ put the whole battery under water to clean it!

I think I would start with determining the type of metal and then obtain a flux intended for that material. Some vendors will sample a 2oz bottle of the flux for free.

Manufacturers of battery packs use spot welding to attach the tabs. Does anyone have a good way to spot weld in the garage?

Yes, I did find that the rosin core solder would not work on the stainless steel cases of these batteries. I hear the warnings about the acid core, will rinse carefully. My concern was not about the corrosion, as I am sure that this will not be a problem in this application, but about the effect of heat on the contents of the cell. Thanks again.

Source record: 87781

I am considering buying a matched pair of huge rotary inductors for a project. These are made from square stock, formed in a helix.

According to the description, they are:

"About 8 inches on a side. One turn per roughly 3/8" or 1/5". Coil is about 6 inches long. Diameter is about 5 inches."

Should I be concerned, or does the shape of the stock in this sort of application not matter?

It is better to install a Low Pass Filter before you meet
and talk with neighbors about your ham radio.
Designed / Built By JR KB5MER
6 Meter Low Pass Filter Models:
#1 Harmonic down 58 dB
Handles up to 250 watts PEP $39.00
#2 Harmonic down 68 dB through 900 MHz.
Handles up to 2 KW PEP $60.00
* Insertion loss less than one (1) dB
*All part as built to with stand a 4 to 1 SWR
*All test were made into 50 ohm load
* Test made by Austin Radio Lab
Price plus $5.00 shipping & handling Con US.

Should be Ok for CW and FSK/PSK too. It isn't linear, and the transistors
it uses can't be made linear with a simple bias network, so don't even
consider using it for SSB.

64. Minimum versus Typical Specifications for ICs

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-03 00:00:00 UTC
From: astone@erols.com
Message-ID: <34AEB2C1.2083@erols.com>
Source record: 87786

Ok -- here's another question for today (I think two is my limit). Does anyone have an idea of what type of sampling, if any, is associated with deriving the minimum and typical characteristics of ICs? Is the minimum spec. nearly absolute -- i.e., 99.99% (or some other percent) of all devices will meet or exceed the particular spec? Is typical the mean value of a sample? Or, looking at it from the practical standpoint, if one designs using the typical spec., how often will that value not be met or exceeded? Of course, I realize if one wants to be really prudent, one should design for worst case (i.e., use the minimum spec.) but sometimes there may be justification not to if one can tolerate a certain failure rate or measure each individual device. What do you all think? Thanks for your help.

73,

Ron (KA3J)

65. Re: Motorola T83 PA - Modes other than NBFM?

David,

You don' mention which "series" of Motorola T83 radio that you
are inquiring about (Micor, Mocom 70, Mitrek "T"-power, "D" series,) etc..
Typically, if its a solid state amplifier, its for sure class "C". Class C amps
are good for FM, CW, digital FSK modes. Class "C" is NOT linear - simply put,
you'll sound terrible on SSB or AM. Oh, and by the way, Motorola used PNP
transistors in almost all of their early solid-state PA's (some rare
exceptions). Difficult to find replacements if available at all! A real pain to
replace! Another thing to consider is how much power you use to drive the Solid
State PA - transistors don't forgive, they just blow.

If its a Tube power amp section, then there is a better chance of changing some
components to get the PA to run class "B" or "Ab" - Linear service - all
modes! Careful! High voltage!!! The tube amps are alot more "forgiving" if
they get overdriven (temporarily of course).

Suggest that you check out the many of the ARRL Amateur Radio Handbooks for
details. You can learn alot from converting and experimenting.

Not for the inexperienced, those voltages (expecially the Tube AMPS) will kill
you!! Lots of "silent-keys" due to hasty decisions or inexperence... They can't
give you any details.... maybe their widows can give you some info.. Please be
careful!

Heat can be deadly. You have to be able to solder *quick* to avoid
causing the cell to overheat, and perhaps rupture in your face.

Use a *big* iron, make sure the tip is well tinned, clean and flux the spot
on the battery where you're going to solder, tin it. Tin the wire. Now
quickly solder the wire to the battery.

The *preferred* method of connecting to these cells is to *spot weld*
the connection. This can be done *very quickly* so the cell doesn't
become overheated. If you don't have the proper spot welder (battery
places have them), you can build your own from an old large filament
transformer and some miscellaneous bits. There was an article in
Home Shop Machinist giving detailed plans for building your own
spot welder (the application was to weld power bandsaw blades,
but it can be adapted to spot welding NiCads too). This is easy
to build, but remember you need both heat and pressure to get a
good spot weld.

Ham Radios For Sale!
HF Equipment
I have a Kenwood TS-430S in like new condition. With mic and
internal filters! This rig also has the FM board in it for working
those great 10 Meter repeaters! It has a general coverage
receiver for listening to Military and Maritime traffic. It has been
professionally modified for MARS/CAP and WARC bands.

HF Equipment
I also have an automatic antenna tuner. It is a Kenwood AT-250
and is a matching set for the TS-430 listed above. This will tune
almost any antenna to work where ever you want it to. Also in
like new condition!

VHF All Mode!
I have an Icom IC-290H 25watt all-mode 2 meter rig. This is an
older rig but works great! This is one of the radios that was built
to last. It has FM, USB, LSB, and CW.

If you are interested please send me some E-Mail at the address below
and we can discuss pricing. Or check out my web site ad - the URL is
also listed below!

>Should I be concerned, or does the shape of the stock in this sort of
>application not matter?

I've heard it said that theoretically, the "Q" of a round conductor is
higher. I wouldn't worry about it, though. Many LARGE inductors used
in commercial high power transmitters are made with rectangular wire.
The inductor in my old Johnson Kilowatt Matchbox is made with
rectangular wire, and it works fb.

> 240V types

Yes. The wall outlet should have a 240 volt NEMA receptacle installed suitable to the current rating of the 240 volt branch circuit.

The amplifier should then be configured with a 240 volt tail and plug to match the 240 volt wall outlet. You might be able to get away with replacing only the plug on the existing line cord.

There is no "adapter" thingy that I'm aware of to mate a 120 volt plug to a 240 volt outlet, and if there were, if should be taken off the market .. Things like that tend to kill people ....

How is your German? There were a few articles in german magazines
(cqDL, Funkamateur)...
Don't worry, a very simpel schematic (with a max232) will do the job.
Unfortunately, my simpel interface did not cooperate with any of the
programs (not too many though...) I found on the net. But I could use
a regular terminal program and send commands manually.
If you need the schematics, I could scan a few (simpel to advanced)
and send by PM (don't want to be killed for posting it here...).

I work for a semiconductor manufacturer, but I don't work in the test area (where your question could be answered with certainty). However, I know that my employer uses the "six sigma" rule for quality control.

If your new to statistics, sigma is the standard deviation of the process. I forget exactly what each value of sigma translates to so I'll wing it... 1 sigma is something like 68% certainty, 2 sigma 93% or so, and 3 sigma is 99% approximately. A six sigma process will give 99 and several decimal places of percent certainty that a devices "spec" will fall within 6 sigma of the mean (or average). As for designing for worst case, it would be kind of hard to get ahead of the competition that way, don't you think. 99.999.....% certainty is a more profitable approach. Of course, there is that less than 1 percent batch of parts that will fail prematurely or not meet the rated specification.

A devices limits of operation are derived directly from exceeding the limits of and destroying enough devices to establish a statistically significant mean and standard deviation. The resulting values get published in the databooks and the manufacturing process controls every step, statistically, to ensure these values are upheld.

I hope this answers your question somewhat.

There was an article about this in Ham Radio, towards the end of that magazine's life. I'd guess 1988, but it is a guess. Perhaps someone else with a cumulative index can search for it.

The author compared various diodes, and I can picture the table.

From what I've read, it is not a long shot to consider a non-varicap diode for that application. Way back when Sam Harris wrote the first article in CQ on parametric amplifiers, when the varicaps were new and expensive, he suggested trying whatever was at hand first.

I've seen many an article where the author has suggested using things like power diodes as tuning diodes, and often there is a comment about them being better than "the real thing". Of course, it depends on the application, and I'm sure in many cases the authors have not done extensive testing.

I recall someone talking about LED's in this newsgroup a year or two back. I can't remember if someone had used them successfully, or were asking if they'd work.

One thing to watch, when using non-standard diodes, is to be sure to cover them if they are glass. I recall one article where someone was getting hum on their VCO, until they realized that the glass diode they were using was being modulated by a nearby lightbulb.

KT

I did this back in the mid 80's with the ICF for a government project. Also modified the mixer with a DGMOSFET to significantly reduce BFO / LO pulling. We did use CMOS gates to substitute for the switch matrix, as another responder mentioned. The final unit was able to scan, have stored channels, etc. It even had rudimentary DSP that could identify CW, RTTY or voice to better than 95% accuracy. It had a downconverter that allowed it to be used up to about 1000 MHz, if I remember correctly.

This is quite a bit of surgery, and you'd better forget about returning the unit to original condition once you have done it, but it can be done. We made a prototype run of these, but never produced them in any quantity.

87. FOR SALE: SBL-1 Mixers

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-03 00:00:00 UTC
From: Ori <ori@jps.net>
Message-ID: <34ade847.0@blushng.jps.net>
Source record: 87871

I'm posting this on behalf of my son Etan.
He has a quantity of SBL-1 mixers, that were pulled out of working
RF/IF boards.
Here's what he does:

- Parts are removed carefully, one at a time.
- Excess solder removed.
- Continuity and diodes tested with a multimeter.
- Each part is functionally tested as a mixer in a test circuit board
(17.5 and 14.7 MHz oscillators are mixed, low-passed and output
frequency is measured at 2.8 MHz with a P-P voltage threshold).
- Parts are mounted in conductive foam and shipped in a small box.

Since all parts are tested, Etan will also offer selected high-quality
mixers for a nominal fee.
These units are tested (at room temp) for a forward drop of less than
250 mV on each diode (at less than 1mA) and a spread of less than 3mV
between the four diodes.
You get better efficiency and balance from these selected parts, beyond
the factory's worst-case specifications.

Prices are as follows (US Funds only):
1-5 units: $2.00/each
6 units: $10.00
12 units: $17.00
Selected High-Quality mixers: $2.50/each
Add $4.00 flat rate for shipping in 48 states, $8.00 elsewhere.

(1) Send check or Money Order only to:
Etan Mizrahi-Shalom
2841 Burdick Way
San Jose, CA 95148-2903
Make checks payable to: Etan Mizrahi-Shalom.
(Orders with a personal check will be held until check clears).

(2) Attach one page specifying clearly what you are ordering and
don't forget the name and address.
Attach your e-mail address, if you have one.

This is a part-time operation, so late orders may be delayed up
to 8 weeks.
Please, do not hit reply!
For all queries, you can reach Etan at his e-mail address:
etan@jps.net

73! de Olaf, DL7UND

Hi Olaf. I am also thinking about building a control interface, for a Kenwood TS-50S. A schematic and other info is in the ARRL Handook, 1996 edition, but nothing about the actual commands. I know the command set is probably way different, but the basic means of sending and receiving them must be pretty similar. If you know the Kenwood command set, could you post it? any other info about using the terminal program could also be helpful. I want to write a program for this in Visual Basic, and I can write it as a "front end" for the Windows terminal program if I cant figure our how to directly control the serial port and send data out it.
I tried the Kenwood website, but they don't have much info in the parts I could get to. The site seems to be missing a lot or have some of it corrupted.
I don't want to use any of the existing programs. They have too much dead weight. I just want to write a small pop-up that I can enter with the frequency I want to QSY to. This radio doesn't have a keypad for freq entry.
Later I want to try my hand at a Windows based RTTY program for the Hamcomm-type interface, and I will incorporate the frequency control etc into it, but right now I just want to write a simple freq program.

thanks in advance for anything you can post.

This is something I was going to suggest. If you read ham magazines
from the Gonset Communicator era, the idea of feeding the IF into
a communications receiver was often mentioned.

ONe could in fact make that external receiver a direct conversion
receiver, and make it relatively small.

As for transmitting, one could add an external high level balanced
modulator between the transmitter output and the antenna, and get
double sideband suppressed carrier. Again, in the old days this
was something you'd see in articles, to make those Two'ers and
Communicators more modern.

Need an equivalent to CNY43 (or an actual CNY43, if you've got one in your junkbox) to repair elderly Philips PM3226 CRO. Would consider junk PM3226 if power supply section OK.

CNY43 is featured on p78 of 1977 Philips General Catalog 9399 093 19501

Thanks

>Ron (KA3J)

In the 1N4000 series, the 1N4007 is the only one with a PIN structure. It's carrier lifetime is long enough to be used at least to 80 meters, and I suspect 160 although I haven't tried it there. They are no more expensive than 4004's at the flea markets, and not much more so purchased new.

>Al W6LX

Sheeeeeeeeesh. Well, you certainly want the plug and the receptacle to match, but you don't want to wire 240 volt service to a 120 volt receptacle. It violates code, and the only guy I know that did that had a terrible experience when the cleaning lady tried to plug in the vacuum cleaner in his innocent looking wall plug.
If your homeowners insurance company can ever prove that you did that after your house fire, they'll void your insurance and not pay for the cleanup...Much less the funeral.

Hit on your local hardware store, they have a half dozen specific 240 volt receptacles (Determined by amperage capability) and NOBODY can get a 120 volt plug into one.

With that call, you are extra class, right?

99. Return-Loss-Bridges, different

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-04 00:00:00 UTC
From: LA8AK@no.dial.tone
Message-ID: <34aed3fa.7063190@news.online.no>
Source record: 87804

in ARRL Solid state design, page 154 (fig.36) is shown a a circuit diagram for "RLB", the same circuit is repeated in figure 37, then called a 6dB "hybrid combiner", it is also mentioned as "hybrid combiner" in ARRL 1996 handbook page 26.37 fig.26.51

In ARRL 1996 handbook pg.26.39 fig.C is shown a different version.

It is easy to see that either bridges are balanced with "unknown" impedance of 50 ohm, detector voltage will be zero.

My question is whether it is unimportant which bridges to choose? I believe G3SEK, Ian showed one of these version recently, but I am not able to trace this note.

Since it is not easy to achieve broadband performance using toroid transformers on VHF/UHF a simpler version is shown in G3SEK's "The VHF UHF DX book" fig.12.13 page 12-19.

Al , the electrical code forbids using a plug with parallel blades on 220 volts or higher.. if you wire an amp for 220/240 volts you should change the plug to one of the various 220 types. Harold W4PQW

101. 7 MHz Loop Antenna

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-04 00:00:00 UTC
From: Jay Moyer <bjmoyer@wcic.org>
Message-ID: <34AF1873.6601@wcic.org>
Source record: 87806

Hello in need help with this delima. I got the ARRL antenna handbook 17th edition and on page 5-18 there is a 7-MHz verticle wire loop antenna. I live on a farm so there is alot of buildings. The one that I think would be best is the tallest barn with a tin multi slope roof. The first slope is about 20 degrees from verticle and the second is about 45 degrees, the other half of the barn is the same. If i built four of them two of them would give a high angle propagation and the other two a low angle propagation but what effect would the tin roof have on the antennas, would puting the antenna on standoffs help? Could I phase them all together to make one kick glutius maximus. The antenna if it worked would transmit east and west. I could do the same thing on another barn for the north and south. If you have any ideas please reply

Thanks in advance for the input

Jay Moyer

From: gilly@camtech.net.au
Message-ID: <34b9687b.13445265@news.camtech.net.au>
Source record: 87811

Hello to all on the newsgroups.

I have an Phillips 828 UHF W2 (500 - 520 Mhz version) and I am thinking of using the amp section as the final amp in a 432 Mhz transverter .

The Transverters output is approx 100mw.

According the specs in the handbook the only changes required to the TX PA are 5 capacitors to bring the amp back down to a "T" model (420 - 440 Mhz)

The final would also need to have some form of bias setup for use on SSB.

I am interested if anyone has "played" around with this idea and can tell me if it was successful or not and could provide me with any hints.

Thanks in anticipation.

Alan gilly@camtech.net.au

I built the 40M version of the NNIG superhet from the ARRL 1995
Handbook. Iused the kit supplied by Dan's Small Parts (US). There is an
error on the board layout. If you follow the layout shown, the source and
drain will be reversed. When Q2 is installed correctly the receiver works
fine but the audio is a bit low. There are several versions of the NNIG
which have been published by the ARRL so you should specify exacly which
version you have built in future correspondence.
Hope this helps...

From: Ori <ori@jps.net>
Message-ID: <34afa85c.0@blushng.jps.net>
Source record: 87815

The 1N4000 family exhibits a capacitance range of less than
1 pF to over 6pF on the average, with reverse voltage of up
to 9V.
However, many units show a 2X deviation.
If you intend to use it for rubbering a crystal, then it's
not that important what's the high value, where the F/V change
is minimal. At the low value, the crystal may not work at all,
so you have to provide more parasitic cap.
This was successfully utilized in the Norcal "38 Special" kit.
Similarly for a VFO. I would design the "varicap" into a
circuit with series and parallel capacitors, which compensate
for min and max deviations.
I would not use them in tracking receive filters, where the
intermod characteristics are important.
The bottom line is that the 1N4000-type diodes are not as good
as the "real thing", but can be made to work - when designed
in correctly - and are definitely cheap!

The message <19980104150101.KAA19114@ladder01.news.aol.com>
from n2icz@aol.com (N2ICZ) contains these words:

> Please forgive the novice question here, but is it possible to convert one of
> my older 2M FM rigs (without tones) to 2 meter SSB? Are there conversion
> circuits or kits available?

> Thanks and 73 to all!

> Larry-N2ICZ

I very much doubt it Larry, or rather, not without major reworking.

In a nutshell, the output from an FM rig is non-linear and SSB needs
to be linear (well, more linear than FM anyway)

So, the Power Output module would need reworking for a start.

Now, if you want to go deeper, the modulation stages in an FM handie
are, well, designed for FM not SSB, so you need to generate an SSB
signal in a different way from the FM one (Hey, all you techies out
there I *know* this is a simplified explanation, but give the guy a chance!)

Then there is the problem that FM uses the carrier frequency and SSB
suppresses it, because the receiver puts it back for you.

Hey Larry, don't worry, just sit down and read about SSB generation,
then find a local ham who is more up on the stuff and have a chat
with him. I'd like to think that there are people your side of the
pond willing to help, like there are over here......

One word of advice, anyone who treats you like dirt and wont explain
probably falls into one of the following categories:-

1. A jerk (universally found across the globe) who isn't worth the worry

2. Someone who doesn't understand, but likes to pretend they do, and
isn't worth the worry.

The *real* people are the ones who admit that they probably don't
know everything, but are willing to pass on what they know and to
learn with you......

Hope this helps?

>
The number of different circuits you can make from three resistors and
three ports is pretty limited. It also depends whether you want to
couple the out-of-balance signal to a Detector port, or provide a diode
detector as part of the circuit.

You always have to allow one arm of the bridge to 'float' above ground
in a balanced manner, so the various circuits fall into two main groups:

1. Bridges with one signal arm floating above ground. These require a
balun transformer, with possible problems of amplitude and phase
balance.

2. Bridges with the 'detector' arm floating above ground:
(a) Detector arm couple to a grounded port using a balun
(b) Floating diode detector built-in, with RF chokes to bring out the
detected DC signal.

Types 1 and 2a are OK at HF, where you can build a good balun
transformer, and also for narrowband VHF/UHF applications where you can
use a resonant transmission-line balun.

Type 2b is also OK for HF (it is the basis for all the "SWR analysers")
but with the right components and layout this circuit will also work
well into the microwave region - details in Chapter 12 of 'The VHF/UHF

DX Book'.

I use return loss bridges a lot for accurate VSWR measurements. For HF I use a Mini-Circuits 180deg hybrid with BNC connectors, and above 100MHz the DX Book circuit.

To go any further we would have to draw schematics, and I'm no ASCII artist!

Isn't that becoming a pretty lucrative hobby? Seems to me there was some coverage on television about a company that makes quite a bit of money dealing in vintage computer equipment such as altairs and the original APPLE machines. Seems some people are willing to pay thousands for a stroll down memory lane. In particular that little niche of fortunate souls who grew up on those machines and then went on to make millions for themselves. Nothing like a 4 bit or 8 bit computer. Back in the days when you were considered a genius if you could get an AM radio to play a tune when held next to the blinity light box. "look ma- no 64 bit sound card"

Am looking for a repeater controller.Would need to have voice synthesizer
and autopatch is not a necessary thing. Would be willing to buy if it is
under 250.00 or above that price mark I would be interested in trading some
gear.

Available gear:
ic 727?? i don't remember the mod # but believ that's it. it's hf + 6m
hasonly been used for maybe 20 bours at one field day about 3 years ago.

Also have dualband ht's available:
ic-w2a
standard c-528a
Both have batts, and some other misc accessories.

also have dualband commercial mobile.
alinco ald-24t
single band rx at one time. comes with tt mic.

anything interest you???? let me know. de RodEkholm Jr.

Tony -- WD6AXL

You haveDouble-balanced Schottkey-diode mixers. They are rated for 1-500 MHz
and make real nice passive mixers. You can probably use them for product
detectors and modulators, regardless of the ! MHz lower freq rating. I have
used them for LO mixers with good results, I guess, though I dont have much in
the way of test equip and so I am judging by ear and by what the experts say.
Pin 1 ir RF in, as if from the antenna
Pin 8 is LO in
Pins 3 and 4 are both sides of the IF out.
I'll try to attach a drawing I just did... hope it comes out ok Im still new at
this stuff.

The physical pin locations are

1 3 5 7
o o o o

o o o o
2 4 6 8

hope that comes out right. different fonts might mess up the above ascii
artwork. pin 2 is under the "M" in "MCL".

the SRA-3 might be better for audio freq modulation and product detection,
since the listed rating is 25 KHz to 200 MHz.

These are sort of expensive little devices... I think they are about 8 bucks
apiece these days.

I hope this is how you do it...

123. FET Hartley oscillator waveform distortion

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-05 00:00:00 UTC
From: Leon Heller <leon@lfheller.demon.co.uk>
Message-ID: <NJnblDAofKs0EwIX@lfheller.demon.co.uk>
Source record: 87739

I've built a simple ~10 MHz FET Hartley oscillator, which produces what looks like a good sine wave across the tank circuit. However, the output from a link winding on the toroid (terminated in 50R) has a kink in the top of the positive-going half cycle, something like this:

```
/ \
/- -\
/ \
```

The other half cycle is fine. Does anyone have an explanation for this?

I can understand why there would be unequal half-cycles. The non-linear
transfer function of the FET provides the limiting to maintain a finite
amplitue which is different depending on whether the half-cycle is positive or
negative.
Question - when you observed the tank voltage, was the link terminated in 50R
as was the case when observing the link voltage?
Assuming this to be so, then perhaps the fact that loading of the tank by the
CRO probe when actually connected to the tank is considerably more
than the loading of the tank by the CRO probe when it is connected
to the link has some bearing on the matter. Attached to the link, the probe
probably has little effect on the tank so the distortion component is apparent
but the direct load on the tank may mask this out.
What actually causes the distortion in the first place is a mystery but I have
seen similar effects in simple JFET Hartleys. I've also noticed that the
effect is frequency-dependant. I made a few VFOs in the 100-200 MHz range that
exhibited a "step" effect when tuned over the full range. Could be related to
your distortion.

yes, this might work then. Today we may have different requirements
for performance. It is often a problem with NBFM receivers that
limiting occurs even at first IF stage, so this problem must be bear
in mind to avoid.
>As for transmitting, one could add an external high level balanced

You could divide an available ssb signal (9MHz or other) by number of
multiplication for the 2m rig, mix it to an xtal osc frequency and
amplitude modulate the envelope information from a detected ssb signal
to the transceiver PA. This was often used for microwaves earlier, but
it is perhaps too complicated.
Another possibility is the Weaver type DC SSB principle, you need only
an oscillator signal covering 2m, but an FM transceiver usually have
not much clean signal, often it is at lot of residual FM when the
signal should have a pure beat note.

>gl es 73
>Jonesy W3DHJ

In a word, yes. It is quite simple to key an unmodulated FM transmitter strip. To avoid chirp, and eliminate backwave, differential keying is preferred. But if the transmit section is well shielded, or you don't care about QSK, you can just key a driver stage.

And if you take the signal from the receiver IF before limiting, you can feed it to a HF receiver for CW reception (or SSB reception). The key is to get it before limiting occurs. The best place is usually right off the first mixer, or right after the IF filter depending on how the receiver is built. In essence, the FM receiver serves only as a receiving converter. Most of the receiver is ignored.

Older multimodes with poor filtering can be treated this way too. I took the "panadaptor" output of my IC-211 and fed it to a HF receiver when I first started copying the ZRO tests. That way I could use the narrow filtering of the HF rig to aid in pulling out the weak signal.

I'd already replaced the IC-211's front end with a Mutek board, so the basic noise figure was good. But selectivity still sucked. Using the HF rig for selectivity really made a difference. Eventually, of course, the phase noise of the IC-211 first LO became the limiting factor, so a crystal controlled high performance converter replaced the IC-211.

What seems to be causing the problem is the waveform at the FET source,
which I've just checked, the pos. cycle has a marked double peak. I
noticed that this improved if I put my fingers across the tank circuit.
I've now added a diode, from the gate to gnd, which has cured the funny
waveform at the source. It looks as though the limiting action of the
FET wasn't strong enough. Some authorities recommend not using these

diodes, which was why I left it out. I'll play about with a by-passed source resistor, to see if the problem is related to the drain current.

Thanks for the suggestions, Alan. Knowing that someone else has had a similar problem gave me the impetus to resume poking about.

Hi Al, Install the proper plug for the voltage. Never ever use an 'adaptor' for 220 conversion to 110. This is a sure way to get into trouble. Most hardware stores will have the proper plug and of course the amplifier wiring will have to be re-wired to accomodate the new voltage. 73 W7AX

I have done just this.

The receive side works great. (be sure to use a capacitor in series,
your HF receiver won't like the mixer's B+ supply on its antenna
jack!)

Transmit was somewhat less successful. (I used a Kenwood TR-7730) I
did work someone, but he told me "if a guy wants the QSO badly enough,
he can copy your CW". On the other hand, I've heard of others having
successful CW QSOs by simply hooking a key to the PTT line. Sounds
like it depends a lot on the specific 2m radio.

Hello all I have just gotten a euro 3900 cb it covers 25-28.505 meg
I would like to put on 29-29.7meg(it has fm)and maybe 12 meters if it
will swing that far .
It realy isn't much good to me as it is except for 10 meters.
It seems to have a uniden cb type pll in it .....
I know thats not much info to go on but if you think you can help e-mail
me
mikel@tir.com thanks and 73's mike KB8ENC

I suppose you don't mean B+ = 250V.... it is another problem, any tube
receiver has rather mediocre noise figur by todays standards,
I hope you mean 12V (or less)......

>73 Frank KN6WH nlav8r@aol.com

Frank,

The ones's I have seen (and Built) as well as a fuse have a 'self resetting circuit breaker' made in the form of a bi-metalic strip and this circuit breaker will open up when the pack stars delivering too much current i.e. a short circuit. after it cools down it will reset without user intervetion. The Fuse is at a higher rating in case the circuit breaker fails (product liability and all that stuff!).

143. Repeater desense, what□s the mechanism?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-05 00:00:00 UTC
From: &miker <&miker@ethergate.com>
Message-ID: <34B1869B.9EE@ethergate.com>
Source record: 87759
Cross-posted to: rec.radio.amateur,rec.ham-radio,rec.radio.amateur.homebrew

Repeater desense, what□s the mechanism?

I want to build a small 440 MHz. repeater to be installed in a low-RF interference site.
So I only need to worry about desense from my own transmitter.
Can anyone tell me the desense mechanism?

When I talk with the local experienced repeater builders, I hear that the □front-end□ is being overloaded, with no precise explanation of what that means. I□m not understanding how -20dbm, in my case, is overloading the RF amplifier. Is there a rule of thumb for how much signal is too much?

If I know what I□m looking for, I can figure out how much isolation I need for this particular set of equipment.

Desense, as I understand it, is the reduction I sensitivity at one frequency caused by RF input at another frequency. But just what is happening in the receiver? 5 MHz away is WAY out if the second IF bandpass. Isn□t he input signal is far to small to saturate the first RF amplifier? I□m theorizing that the problem is saturation somewhere in the first IF stage or second mixer.

Can anyone explain what is saturating and give tips on how to measure it and calculate required isolation?

Also can anyone give advice on measuring small signals in the pressence of large signals? I□m so fearful of accidentally keying the transmitter or detuning the duplexer or creating a spur outside the notch that I won□t hook the spectrum analyzer directly up to the thing. If I put in enough attenuation to protect the mixer against full transmitter power, I don□t have enough useful dynamic range. There□s a small limiter in the analyzer, but that just means that I have to replace the limiter AND the mixer. Can I build an

external limiter, with
inexpensive and
available parts, that will protect against tens of watts at 440 Mhz?

TNX for your help, miker

144. Surface Mount problems....

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-05 00:00:00 UTC
From: Paul Breed <Paul@rasdoc.com>
Message-ID: <34B17DDE.F2FE065@rasdoc.com>
Source record: 87760

I am disturbed to find more and more manufactuers
are only providing Surface Mount version of their IC's.

I was looking for general sugestions on how to cope with this?

Has anyone found a service that will mount IC's to adaptor plates
for a reasonable fee?

The PLCC parts can be socketed, but tonight I lost a battle
with a 48 Pin TQFP. (AD9832 DDS Chip)

I can do 8 or 16 pins with a micro iron and micro wire.... but
48 pins were too much.

Any ideas....

We have several GE MASTR II VHF mobiles with the PLL exciter option. Currently set up on 15X.XXX, but will easily move down below 150MHz. These are 65W and 40W units. A couple of them also have UHS front ends. Speaker, mic, cable, head comes with each unit. Radios will be bench tested for functionality prior to shipping. If you want to build a 2m repeater, this is a great radio to do it with. Conversion instructions available. If intersted, please send e-mail to: GWORTH@IBM.NET and also copy ADCJR@AOL.COM (be sure to copy both, as one of us is frequently out of town). $100 + shipping, Postal Money Orders only and sorry but no CODs. Thanks.

You're almost certainly seeing leakage of broadband digital "hash" from
the radio's synthesizer or display/control circuitry into the RF and/or

IF sections. This is very different from a synthesizer phase-noise problem. It's a symptom of poor design involving inadequate shielding; there's really not much you can do about it, unfortunately, beyond trying to add an audio filter to cut off everything above 2-3 kHz.

Squiggy, Squiggy, Squiggy. You haven't restricted the 'calling' to Mike.
You call EVERYBODY who doesn't fit into your mold of the perfect
beeperless electronics engineer the same thing. You have a deep down
hatred for ham radio and everything it stands for. You need help, bubba.

>At least I had a REASON ...

No, you have two reasons. One, because you're you. Two, because you are
obsessed with this code/nocode baloney to the point where it has become
the most important thing in your life.

>That is WORLDS different that attacking a foreigner for whom English
>is a second language for some silly grammatical mistakes just so you
>can take a cheap shot ... one has to wonder if you would attack "Masa"
>so vigorously if he were a) not Japanese and b) not in favor of the

>while I lived in Mexico ...)

Our friend Masa is the town clown, the local jerk, the fool - if we teach him
a few more bad words in English, he may even become world class, like you.
Masa would still be the town clown if he could copy Morse code at 50 wpm.
He enjoys playing the fool - the difference between you and Masa is he
realizes he's a fool. You could turn a church sermon into a no code debate,
Squiggy.

You aren't interested in ham radio - you are only interested in making noise.

You are bitter because you haven't gotten anything out of ham radio because
you haven't put anything in to it. You are very confused.

Let's look at a few things you have said recently:

First, you told somebody:

>Message-ID: <01bd10ca$2914a920$0100005a@wa6vse>

>Yeah ... join No Code International (http://www.nocode.org) rather than
>sending your money to Oldington so they can use it to lobby AGAINST your
>interests and keep ham radio stagnated in the past.

Then you turn around and say:

>Message-ID: <01bd0f4c$55535e20$0100005a@wa6vse>

>I've been a dues-paying member of the ARRL since at least 1975, with only a
>brief lapse in membership while I was out of the country and didn't get a
>renewal notice.

So what is it Sqiggy, are you suffering from a split personality, or are you paying the ARRL 'to lobby AGAINST your interests' one day and then advising somebody else NOT to do the same the next day?

I guess the ARRL is OK for you but not for anybody else. Kinda like CW tests are OK for me but not for you, right ?

Kinda looks to me like you are playing both sides of the fence here Squiggy, and hoping the fence will cave in......

Before you bother to spend an hour trying to type out some explaination for the above, remeber that you you also said:

>Message-ID: <01bd1924$82019220$0100005a@wa6vse>

>The ARRL is ham radio's worst enemy.

>they are just a bunch of mealy-mouthed, weasle-worded
>politicians ... comparable in ethics and credibility to Bill Clinton,
>who is unquestionably the most corrupt, scumbag president since LBJ.

The ARRL is ham radio's worst enemy.... so you have been sending them money for 22 years to support the cause - your REAL cause - you want ham radio to go away. Mealy mouthed, weasle-worded politicians, whom you have supported for the last 22 years by sending them money.....

I don't think you are a hundred percent correct in that last quote, Squiggy. I think people like YOU are ham radios worst enemy. You're like the 4 year old kid whose ice cream fell on the floor - first thing you want to do is grab the other kids ice cream and throw it on the floor - if you can't have any, then you

don't want anybody else to have any either.

You have been a technician class ham radio operator for 25+ years. Nothing about ham radio ever excited you, intrigued you, got you interested. But you did notice along the way that other people in ham radio were having a lot more 'fun' than you were, and that pissed you off.

So then along came the no code tech license, no code international, usenet, and there you were, pissed off, just waiting to jump on the band wagon and see if you could help flush the toilet. You always wanted to be a HERO instead of a ZERO, so here you are typing, in hopes of confusing the sheep.

You have ZERO excuse for being a tech, Squiggy. You have expounded many times in the last two years how much you know about electronics. And a few times you have even slipped up and said:

>Message-ID: <01bd187c$5c2853c0$0100005a@wa6vse>

>I know (and passed a test on) the code ... I'm not as fast as the High Priests
>of Morseodism in Oldington and others like Roll, Carroll, etc. would like to
>see as "The Standard of Excellence," but I could copy CQ at probably 40 wpm ...

Which really blows a big hole in your 'I wanna get on HF to do digital experimentation and bring ham radio into the 21st' century but the code test is keeping me off HF' baloney. If you can copy a CQ at 40 wpm, you can damn sure pass a 13 WPM code test and get on HF and do all the experimenting you want - but that's not the real agenda - your real agenda is to cause as much hate and discontent as possible and see if you help throw the ice cream on the floor.

You're a fraud, Squiggy. A fake. Sad thing is, you have worked yourself up into such a rage and you spend so much time slobbering over a keyboard, that you are about the only one left here that doesn't realize that. You need help. Professional help.

You are not interested in ham radio - you are only interested in making noise.

But I'll tell you what I am going to do. ARRL membership now, I think is $36 a year. I have no idea what it was 22 years ago, so I will use todays figure. $36 times 22 years is about $792. We'll round if off to $800.

I'm going to give you a refund, so you can have back everything you have put into ham radio. You throw away the usenet software and go find a good head doctor.

You explain to him that you are consumed by the fact that you hate ham radio, and ask him if he can give you some help. If he says yes, you tell him to send me the bill for the first $800 worth. I'll look at it as my investment in the future of ham radio......

I've noticed you seem to have a problem finding things I post in usenet lately, Squiggy, so I'll email you a copy of this to make sure you get it. My usenet feed just isn't that reliable, I guess.

On problem with using a VHF or UHF FM rig as a front end for an HF SSB
receiver is that the spectral purity of the VHF/UHF VCO used as the
local oscillator of the FM rig can be pretty awful. While the VCO is
part of a PLL, the loop filter bandwidth can be very low on some FM
rigs, causing quite a lot of phase noise.

This local oscillator noise is mixed with the received signal and an
'aurora' tone would be heard on all CW transmissions :-).

[snip]

Desense does not have to be (and in my experience is most often not)
caused by too much signal into the front end of the receiver. Most
frequently the desense is a real signal on the receiver frequency that
is caused the the transmitter signal mixing with another signal.

The problem is that with the dynamic ranges in a repeater (+50 dBm
transmitter sharing an antenna with a -120dBm receiver) almost anything
can act like a mixer including rusty antenna hardware or a exhaust fan
on
the neighbors house (I've seen them both and more; and yes rust can be
semiconductor). Remember, this mixer can have 150dB of conversion loss
and still cause you problems...

As for 'the other signal' all you need is a signal that is on the
split frequency, or on a harmonic of the split frequency, or any of the
dozens of mixer spur frequencies.

> Can anyone explain what is saturating and give tips on how to measure it

See above

[snip]

> Also can anyone give advice on measuring small signals in the pressence
> of large signals?

It is very tough to measure. Best to divide and conquer. Get the radio transmitting and receiving with seperate dummy loads. Add the duplexer and make it work with a single dummy load with no desense. Add the feedline.
Repeat. Add the antenna. Repeat. Add the final installation. Repeat.

Bob

Interesting - I'll keep a look out in March/April when it hits the news stands here.

Has anyone used a 4066 as a balanced modulator for SSB/DSB gear. Better still, have you used a CMOS chip biased in linear mode for the speech amp (eg 4007) and xtal oscillator (maybe using 3.58 Mhz ceramic resonator VXO).

To me that would seem to be an ideal exciter for QRP SSB/DSB rigs.

If your receiver has a squelch line, use that to key a transistor switch.

If there's no squelch line (which is doubtful), you'd have to either use
a VOX system (which may cut off the first syllable and drop out between
words) or make some sort of noise detector device that filters white
noise and activates a transistor switch when it's present (or absent).

However, you'd be stuck with the radio's standard 5 kHz channeling. Thus you may be off frequency when you call others - being 500Hz off freq on SSB would make your sig unreadable, whereas it's nothing on FM.

If you want to build simple gear for the SSB/CW end of 2m, you have two options. These are:

1. Build a transverter for an HF rig

2. Build a 2m DSB/CW rig featuring a VXO (see Solid State Design)

I had this problem mounting AD9850 DDS devices on adaptors for
prototyping.

I have a small local specialist SM assembly firm that will do this sort
of prototyping job quite cheaply while I wait, you might be able to find
a similar outfit. They have a young chap with good eyesight who works at
amazing speed with a very fine-tip soldering iron, and low-residue
solder. They also have one of the latest pick-and-place machines for the
bigger jobs.

I have done it myself, if not as neatly. Tack down two diagonal leads to
hold the chip in position, then run an ordinary soldering iron across
all the leads with plenty of solder (don't worry about the bridges).
Then remove all the excess solder with narrow desoldering braid. Inspect
all the joints (I use a cheap microscope), and reflow the dodgy ones
with your micro iron. I used ordinary solder and carefully removed all
the flux. It took me *much* longer to do a single 28-pin SSOP device
than the aforementioned chap took to do 12!

Source record: 87682

I have used the 4007 for several projects. The various parts
make a fine DTSP switch.

Uhlriche Rhode (sp?) had a series of articles in QST a few
years ago and mentioned the bilateral MOSFET switch as a good
demod. Gave diagrams, too.

I plan to try the 4066 in a phaser. The EA phase shifter for
PA use had a nice 90 deg shifter circuit.

Hi radio lovers,

I need a design for a HF receiver (3.5MHz-30MHz but at least 3.5-18M) that is OK for a back yard (which has a pool, garage etc). I have seen a commercial VERTICAL affair but was many meters high (and vertical and expensive ..how does this pickup horizontally polarised signals (I'm new to this, as you can tell).

If you can help please either email me advice or post it here. I am very appreciative.

S.Burrows@mailbox.uq.edu.au

You did not tell, if you had a common antenna for Rx and Tx, duplexer
type (bandpass/notch) on Rx (and Tx) and transmitter power, so I have
to guess in some points.

>So I only need to worry about desense from my own transmitter.

>Iï¿½m not understanding
>how -20dbm, in my case, is overloading the RF amplifier. Is there a
>rule of thumb for
>how much signal is too much?

It depends quite a lot of the receiver design.

A typical UHF receiver has at least one RF amplifier before an active
mixer. The gain from the Rx input to the mixer output might well be
+20 dB, so the Tx signal leakage is now at +0dBm (provided that it has
not been attenuated by any bandpass (helical) filters between the
RF-amplifier and the 1st mixer. While +0dBm into 50 ohms is still only
220 mVrms, the active mixers usually operate at higher output
impedance levels such as 1 kohm. +0dBm into 1 kOhm is 1Vrms or nearly
3 V peak-to-peak, which is uncomfortably close to the operating
voltage of a typical front end. There are strong mixing products at
fTx-fLo and fTx+fLo and if these frequencies are not terminated into a
proper impedance, these can cause problems to the mixer.

A typical NBFM receiver will give a usable signal at around -120 dBm
and if you try to get that sensitivity with the -20 dBm Tx leakage,
you still need a 100 dB dynamic range, which is hard for an
RF-amplifier. A few years ago, it was hard to get 100 dB dynamic range
even with audio amplifiers with feedback.

The 100 dB difference between the weak wanted signal and the strong Tx leakage also means that the strong unwanted signal must be suppressed by more than 100 dB (relative to the wanted signal) before it hits the first stage that limits. Due to filter "leak around" it is very hard to get this kind of attenuation in a single filter even if the filter itself could attenuate that much, so a careful gain distribution must be used between multiple filters.

One thing in repeater desense cases, which is easily overlooked is the phase noise of the transmitter. If common Rx and Tx antennas are used, the phase noise of the transmitter as far out as the Rx frequency can be so strong that it swamps a weak signal. While a notch in the Rx chain tuned to the Tx frequency effectively attenuates the nominal Tx frequency to tolerable levels, it does nothing to the far out phase noise, which will penetrate into the receiver without attenuation. If the target sensitivity is -120 dBm and assuming for simplicity, that the needed signal bandwidth is 10 kHz, the phase noise density must be less than -160 dBm/Hz. If the transmitter power is 100 W or +50 dBm, the maximum phase noise density at +/- 5 MHz from the carrier must be -210 dBc/Hz. If the phase noise for a typical UHF FM transmitter at that offset is -140 dBc/Hz, the notch (tuned to the Rx frequency) in the _Tx_ to antenna line must be at least -70 dB deep.

Incidently, the notch required in the _Rx_ line is also -70 dB (from 100 W or +50 dBm to -20 dBm) so about the same amount of filtering is required in both the transmitter and receiver feeder lines. While it is important for the health of the receiver to tune properly the notch in the receiver feed, for optimum performance, the notch in the Tx feeder must also be tuned very carefully.

While the transmitter phase noise (-140 dBc/Hz) used in the example might apply for a bad synthesized FM transmitter, better far out noise performance can be obtained with crystal controlled multiplier chains. Using multiplier chains it can be easier to find suitable helical filters (at say 144 MHz) to clean up the far out phase noise. When (most of) the filtering is done in the multiplier chain or before the final amplifier at the operating frequency, small, low power filters can be used. If the notch is between the transmitter final amplifier and the antenna, RF generated at high cost are used to heat the duplexers, since the notch filters have some pass band losses at the Tx frequency.

Not on the GSM setwork. In the nordic countries we also use NMT,
which can easilly be tapped.

I've put all the Micrometals toroidal core data into a Quattro spreadsheet, together with the formulae. It's a very good way to design coils using these cores. It won't take long to do this for yourself, but if anyone would like a copy, please let me know. I can export an Excel or 123 version.

I've just redrawn the mixer circuit with my PCB package and can post it
to anyone who is interested, as a .GIF file (~15 Kbytes), to save you
waiting for the mag.

I'm in the middle of building the mixer circuit. It uses a 74HC04, with
the first inverter biased as a linear amp. to convert the VFO to CMOS
levels to drive the HC4066 analogue sws (it doesn't need much RF from
the VFO). The switches are parallelled, to reduce their resistance. I'll
probably try it initially as a mixer into my Sony 2001, driving it with
a sig. gen., with a 50 ohm broad-band amp. following the mixer to make
sure that it is terminated OK.

It should work the other way round, as a modulator. There are three
spare inverters in the HC7404, which could be used for other functions.
like a speech amp.

Many radios can do this.
Easily.
I cut a green wire on my Yaesu FT-530, and it receives cellphones. I did it mainly for the out-of-band transmit on UHF, because the radio, when at lowest power, puts out legal power in the FRS frequencies, so i can talk to my friends who have FRS radios. That turned out to be kind of a waste though, so i just left it modified for the sake of not opening it back up and fumbling with rediculously small wires.
So yes, for a FACT some FT-530s (later models had some components changed and may not be able to get cellphones though...) do this, and many scanners do, and i've seen an alinco, and an icom do the same. I'm sure that there are many others.

Even though the US is the only country I know of to fight for the right of other countries to be able to listen to any radio they wish and then a few years down the road, turn around and make it illegal in our own country, I think many people can and do listen to cellphones... I tried to see if the mod sheet i followed was correct. But seriously, who would care to listen to a bunch of "hi hon, i'm on my way home, do we need milk?" conversations? Sorry, but even though my rig does it, i'll stick to scanning the police freqs, weather freqs, FRS freqs, and of course, the Ham freqs..

Eavesdropping just doesn't seem "right..."

;)

Ferranti (now-extinct) ZN 414. Looking for technical specs and application notes. Can't seem to find much on the web (some stuff on "Harry's Home page).

Seems to be a great candidate as a IF. Would like to integrate a product detector/BFO.

Neat little IC.... 3 leg TO-92 plastic case- Multistage TRF AM receiver with detector and AGC.. Added a 741 op amp to the output, and a tuned circuit for the AM BCB on the input... Very impressive little AM radio!

Any suggestions, specs, practical circuits??

Thanks in advance.

Scott

Well, there's your problem. You're trying to do SMD with a
soldering iron. Toss that antique in the rubbish. You need
a static hot air source and solder *paste* to do SMD work.

The Weller Pyropen Jr is a fine static hot air source for most
SMD parts. For the really big ones, you might use its big
brother, the Pyropen, or an ordinary propane torch fitted
with a homemade hot air shroud (I've used both).

You need to deliver enough static hot air to reflow the solder
on *all* the pins at once. It only takes a second or two to do
even the largest chip if you have the right hot air source and
the right shroud.

Working with SMD is much easier than working with thru-hole
parts once you learn the technique.

Decent price on the PK-232 Rich. Is it pre-packet, or does it do packet? I got an old pre-packet, pre-MBX one and I have never upgraded it. Thinking about starting into Pactor.

It's good up to about 1.5 MHz, as I recall. I remember seeing a design
for a SW Rx some years ago, using the ZN414 as the IF amp and detector.
A product detector isn't feasible, because you can't get at the signal
before the detector.

A long time ago my brother's step-daughter asked me to make her a
miniature radio that she could use at her boarding school (they weren't
supposed to have radios). I used the ZN414 and got the whole thing,
including a hearing-aid cell, tuning cap. and ferrite rod antenna, into
a plastic case about 3 cms square and 1 cm thick.

Hello Luis,

I also own one. The amreican version.
I could xerox the scematics for you if you want.

It is better to install a Low Pass Filter before you meet
and talk with neighbors about your ham radio.
Designed / Built By JR KB5MER
6 Meter Low Pass Filter Models:
Model#1 Harmonic down 38 dB @ 75 MHZ
52 dB @ 100 MHz
58 dB @ 120 MHz
Handles up to 250 watts PEP $39.00
Model #2 Harmonic down 68 dB through 900 MHz.
Handles up to 2 KW PEP $60.00
* Insertion loss less than one (1) dB
*All part as built to with stand a 4 to 1 SWR
*All test were made into 50 ohm load
* Test made by Austin Radio Lab
Price plus $5.00 shipping & handling Con US.
kb5mer@aol.com

175. How to make capacitors?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-06 00:00:00 UTC
From: chris.otley@virgin.net
Message-ID: <34b397e4.5594044@news.virgin.net>
Source record: 87702

Hi All,
I am not sure if this should be addressed to this News group or the Antenna Group. Anyhow you most likely look at both so here it is.

I have a few ideas about the construction of a high voltage capacitor for a 'Magnetic Loop Ant', using 35mm and 28mm copper tubing with PVC insulation.

I need to make something in the region 10pf-200pf with 10KV rating, and motor driven with some form of feedback to give an indication of the capacitor position.

I wonder if anyone "out-there" has practical experience of construction and weather proofing of such a device and may be send me a few of your ideas on this subject?

73, Chris....

REPLY...

Not with GSM (the system used in Portugal). I suppose it is possible to pick up the GSM network, but not that easily. However, he might be able to use a modified radio to pick up the actual cellular phone (and local repeaters that are not on the GSM system), but that would be very limited.

He best bet would be to look around the internet for radio modifications, modify his radio, and hope he gets lucky. Or he could try to find the guy on the television program and ask him how he did it (ask the tv station for the guy's name and address).

178. MFJ AutoTuner Theory

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-06 00:00:00 UTC
From: Al Williams <alw@al-williams.com>
Message-ID: <eCjZESuG9GA.348@nih2naab.prod2.compuserve.com>
Source record: 87705

Hello all.

I was noticing the other day that MFJ sells an auto-tuner extender designed to allow the internal autotuners on the new rigs to match odd antennas. Most of these internal jobbies only do 3:1 or less before they blow an underrated capacitor in the thing.

I don't own one of these, but it appears to be one knob and some coax connectors.

Now I got to thinking: what can this be doing. My first guess is it is a large torroid wound as a transformer with one side going to the antenna and the other going to the radio via the switch. The switch connects to any of several taps on the transformer secondary so you can transform various mismatches to a different range (Zp=Zs* N*N, right?). So with a 10:1 turns ratio, you'd bring a 300:1 match down to 3:1 (or a 1:10 ratio depending on the direction of the mismatch). With a 3:1 ratio, you'd could match 27:1.

Anyone have any thoughts on this? I've never seen any articles on this sort of thing. I don't even know if that is really how it works. What about the impedance of the coils? Can't null them with capacitors since there is only one knob. Maybe the XL is so high as to be unimportant compared to the reflected? How big a torroid would you need to handle the 300W this one does? What's the downside? Obviously there is some hysterisis loss in the core and resistive loss in the windings. Anyone have one of these? How does it work for you?

Well, sorry I got off on a jag. Just curious if I want to try to build one of these or pay Martin $40 and see how his works.

: How does a year in the slammer sound???

Like a major breach of my guaranteed first amendment rights.

Think about it, the government is trying to regulate what you should and shouldn't listen to. Granted, its not a new thing, but laws about it seem almost as rediculous as prohibition...

The same freedom the US fought for for other countries is now in jeopardy IN THE US ITSELF!

and why? cuz some senator got snitched on when someone heard him talking about his scandalous affairs on a cellphone....

When (maybe if?) people realize almost anything that is wireless (note that i am not DISCOUNTING things WITH wires here... :) can be received by other than the party intended as the recipient.

If you think about it, weigh all the angles, and dont just spout off for some reason (like if you have a cell phone or something), you can see that making such a law as the one that exists is a waste of paper.

Now, i don't listen to cellphones, frankly, i'm not interested.
Nor do i plan to be. In fact, I also find it sad that it is almost impossible to find a way to communicate using wireless methods without the risk of a third party interception. Hey, i'm just like everyone else and sometimes want my privacy. But there comes a point when you have to be aware of what is out there and how to protect yourself. Ever see pulp fiction? When he is bringing the Overdosing girl to the seller's house, he realizes that the guy is on a cellphone, and immediately hangs up after claiming audibly "prank caller prank caller, who is this? i dont know you!" Now, beit a somewhat semi-believable and far-fetched example, i think we should all think about what means we communicate through, because you never know who is listening...

I can't wait until the day they make it illegal to hear someone who is talking above average volume to another person at another table in a restaurant.

Doug, you peaked my interest. Ive had all sorts of troubles soldering and welding various metals. What type of alcohol do you use. Anhydrous just means without water, but there are literally hundreds of alcohols ranging from solids to volatiles. Is it methanol, ethanol or what? Also, since many alcohols are hygroscopic, what degree or percentage of water contamination is acceptable? Thanx in advance,

Don

Source record: 87711

Al, you can use 110 stuff. Be sure to get a husky plug. I have a 220v air compressor in my shop wired this way. For the same amount of copper (and current capability) the 110 hardware is cheaper. But as others have warned, if an unknowing person plugs a 110 appliance into the socket, it will usually destroy the appliance. Probably no-one killed (they usually let go when it flames!) But be carefull, no one should be in my shop without my knowledge, but I still put a small warning over the outlet, and its high enough that the kiddies shouldnt be able to stik a bobby pin in it (110 will give them enough charge when they do that stuff)
Incidentally, years ago, a friend and i wired a patched linear power supply from a kitchen table directly to the hot water tank for about 20 minutes of testing to evaluate the transformer, caps and diodes for a proposed supply for a linear amp. Everything went great, we got our data, no problem. About a month later, the hot water heater went out and his xyl swore that we were the cause of it a month before, but she could have been teasing us! At any rate, watch out for any children.

Horowitz and Hill (Art of Electronics) suggest using a simple pull up resistor or a level translator chip to accomplish this. In the case of the pull up, they indicate that the smaller the value of the resistor the faster it will be but with increased power consumption. My question is, what works well here and what frequency limitations can be expected? I'll be running at about 3 MHz max into the clock input of a 4026BE which can handle at least about 6 MHz. Thanks for your help.

73,

Ron (KA3J)

>like a speech amp.

One problem with 4066 switches is that there's a lot of coupling from the switching signal to the outputs. A glitch on every edge. So for a RF mixer, the LO supression isn't going to be that good. (On one job I had, the designer ended up redesigning a board that used a 4xxx series chip to use an Analog Devices part designed to have lower feedthrough because the glitch out of the mux was blowing big chunks out of the following A/D's linearity).

Horowitz and Hill's "The Art of Electronics" has a great section on FET switches.

I was looking for (and found) data on the ZN426 D/A converter a few weeks ago. GEC Plessy Semi has a obselete chips section on their web site. (Something like http://www.gpsemi.com). It's not obvious how to get there. You run a search on the part number, and after that they say, the equivalent of "gee we don't know that that is, try this page", you get to another search page for the obselete parts.

That being so, how would a 1N4007 go as a PIN diode in a T/R switch unit for VHF (and UHF?).

What are the reasons for it not being the preferred device for T/R switching? It would be cheaper to use a 1N4007 instead of a normal PIN diode.

>I hope you mean 12V (or less)......

Yes, I meant 12V, but that's still more than the input of many HF receivers would want...

(if anyone has any good ideas of how to key a TR-7730 to provide a decent-quality CW signal, let me know, I'd love to get back on 2m CW! I have also tried hooking the key in the 12V line to the PA module & leaving the rest of the transmitter enabled with the PTT, but it didn't work any better. Really should just fix my transverter...)

198. # Need suggestions: Noise in HF rcvr channel

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-06 00:00:00 UTC
From: wb4lnm@aol.com
Message-ID: <19980106030100.WAA07960@ladder02.news.aol.com>
Source record: 87770

I've got a small commercial HF transceiver (from Tokyo Hi-Power Labs) that I use on business trips and vacations. It works very well, but there has always been one tiresome problem. There is a high frequency noise, which appears to be internally generated, that occurs whether or not the transceiver is connected to an antenna. The amplitude of the noise varies with the setting of the AF gain pot, but not with the connection or disconnection of an antenna. This is a different, and much higher frequency noise than the normal "receiver noise". I'd appreciate thoughts on getting rid of the noise, if possible. It is pretty tiresome, especially when 'phones are used. I'd guesstimate that it is above the necessary audio communications bandwidth.

The receiver is a conventional superhet with a crystal filter and product detector (SN76515 IC). The output of the detector goes through a series inductor (470 uH) and a shunt capacitor (0.01mfd) to the hot end of a 10k pot. The wiper on the pot goes through a 10 ufd DC blocking cap to the input of a National LM380 audio amp IC. There is a 10k resistor and a 0.033 ufd cap shunted from the LM380 input to ground, but otherwise the '380 is run full gain. The output of the '380 has a series 100 ufd electrolytic in series with the speaker, and a 33 ohm and 0.1 ufd cap in series to ground (to prevent high frequency oscillation, according to the data book).

Since the noise amplitude varies with the AF gain pot setting, I'm guessing this audio high frequency hiss is NOT being produced by the LM380 circuit, but coming out of the product detector. If that is the case, what is generating it?

I will add that this transceiver has a synthesized VFO, in 100 Hertz steps. If non-purity of the VFO output is the culprit, it does not seem to have been a problem when receiving strong adjacent channel signals. Also, I'm not sure I can picture how this would create the problem if there is no signal input, and the hiss is certainly there even with no antenna.

If anyone has any ideas about figuring out what is causing this, I'd appreciate them. It would not be easy to substitute a crystal oscillator for the VFO, given the packing density of the radio. I'm thinking about increasing the shunt cap coming out of the product detector to roll off its response down into the lower audio range, but am concerned this is fixing the symptom instead of the sickness. Please respond here, or to WB4LNM@aol.com Thanks and 73. John...

>few of your ideas on this subject?

73, Chris....

I would try an idea I saw written up a long time ago. This is assuming you want a split stator cap. The rotor is a U-shaped assembly of copper pipe and 90 degree elbows. The stator is two pieces of copper pipe covered with mylar that can fit into the legs of the rotor piece. As the rotor slides further onto or off of the stator pieces, the capacitance is varied. Motor drive is simple... a threaded rod driven by a motor... either a stepper or a gearhead lowspeed DC motor. I first saw this in conjunction with a compact loop also made of copper pipe.

As for position feedback, the low-tech solution would be a piece of string hanging down from the rotor with a weighted pointer tied to the end, and a calibrated scale behind it. Otherwise, try a potentiometer with a pulley on the shaft, and a piece of string looped from and then back to the rotor in such a way that rotor movement turns the pot. a low DC voltage through a 1K or so resistor through the pot and returned to a cheap meter movement complete the setup. Open up the meter and cover up the calibration markings with blank

paper onto which you make your own markings corresponding to position. You can calculate a better value for the 1K current limiting resistor and the position pot, and add a couple of pots for max scale and for zero adjust. This will give you a nice analog readout. If you will settle for low resolution digital, an array of LEDs and photodetectors seperated by a card with strategic holes punched in it can serve as a sensor, and you can get as low or as high as you like for a readout.

Personally I like the string and weight.

I wish I could remember where I saw the design for the loop and capacitor, because there was a source for the mylar and some notes on construction technique.

The capacitance can be calculated to within about 20% using the formulas if you know the dielectric constant of whatever material you use. Allowances must be made for the fact that you are not using flat plates which is why in the article the author noted that actual capacitance was somewhat different than what was calculated. Or, start with a rotor about 1 1/2" wide and about 8" long, build it, measure the capacitance, and cut till you got what you want.

Good luck. I wish I could tell you I have used this type capacitor in a loop antenna, but I haven't.

Message-ID: <34B332F4.AA22044D@xs4all.nl>
Source record: 87628

Hi there,

I wander if any one can check if I have the right calculations.

My plan is to replace my FD3 (40 mtr band windom) by a large dipole since I am not happy with the reception as it is on this moment. This FD 3 is sloping down from the roof of my house.

Main use off this antenna will be listening to the HF bands with my Kenwood R5000.
The secondary use will be for my old CB transceiver (just low power for packed and dx work when the conditions get better).

I found my neighbors across the street willing to hang one end off my new antenna at their roof top (dead end street with no traffic). At the back side off my house stands a small tree that I also can use for my hobby ;-)

I have been calculating the following:

To be in resonance for my only TX aplication

(11 mtr - 5%) X 4ï¿½ = 47 mtrs (143 ft)

The 23.5 mtr across the street will be flat at 10mtr (33 ft) above the ground.
The 23.5 mtr to the tree at the back sloops down to aprox 6 mtr (18 ft).

According to a chart in my book I found a R off:
+/- 130 ohm. for the 4ï¿½ wavelength antenna. (this is the only TX freq. I might use)
+/- 90 ohm for a 2 wavelength antenna
+/- 90 ohm for a 1 wavelength antenna
+/- 60 ohm for a ï¿½ wavelength antenna

These R's are theoretical (free space) but since this antenna will be at 10 mtrs (33 ft) an other chart tells me an average off
70 ohm for a half wave dipole. So I guess that I will have to add an other 20 ohm to the above calculated R's.

I have to feed the antenna with +/- 7 mtrs (21 ft) off 50 ohms R213 coax.

So if I want to feed this dipole correctly I will have to use a 1:2.2 balun.

For best receiving performance outside these bands I am planning to use a matchbox / pre selector.

Am I right ? Am I wrong ?
Where can I get a good 1:2.2 balun ? (seems that no one has such item)
Any use to use a Radio Works T4G line isolator ?

Well thanks for reading this. And I would be very pleased with your comment.

Kind regards,

Roger Willems
The Netherlands

206. Converting FM tuner band

Hi,

I have a Japanise FM radio tuner (midi unit) which uses a diffrent radio band than the uk (70-85MHz approx) instead of 90-105. The unit has a digital frequency display and uses a LM7001 and BA1485 chipset. What is the normal method of changing the bands ? (crystal change). Or is this not pratical as the front end filtering would also be wrong.
Its a bit of an open question but would be interested in any advice

Thanks Steve...

From: DavidC <davidc@bit-net.com>
Message-ID: <01bd1b21$01cfaca0$098a92d0@bitnet.bit-net.com>
Source record: 87631
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.swap

I have three 5V 200A power supplies (amazingly small, about 12" deep x 5" wide x 8" high, though very solid and heavy). They weigh approx. 15 pounds each.

They are JETA Power Systems, Inc. Model G1001-1
Label says Input: 3 phase 208v 3.5a 47-400hz,
OR 230v 9.6a 47-60hz
Output: 5v 200a

Each unit has its own built in fan, massive plated connection posts, etc.

(Several of the wonderful Hams here on the newsgroups have provided wonderful info. as to how I might tie them together for a massive 12v 200 amp supply - thanks again! I'm not going to do that project, but someone else can - I'll include your suggestions with the supplies!)

I have arranged to acquire a supply that is designed to provide 12v at all of the current I could ever want, so I am selling these. I am told that many people are now discovering that these (screwdriver) adjustable 5v supplies with high amperage are very valuable to have (or to use via the tied-together-for-a-massive-12vdc-supply-thing).

I may keep one, just in case I discover a need down the road! :-)

I'm asking $75. plus actual shipping for each.

FWIW, PVC does not behave well as a dielectric with RF of over a few watts. It heats easily at HF frequencies. I don't know if this antenna project is for transmitting or receiving. But if the former, you may want to try a different plastic. I'm guessing you're planning to use PVC water pipe. I believe for little more money, the "other" plastic water pipe (polyethylene?) you can find at the hardware store is a better material.

> sgw1002@cus.cam.ac.uk

It'd be a mistake to try to modify the tuner for this purpose. 70-85 is too far from 88-108 for a simple "tweak" -- you'd have to rework the VCO tuned circuit. And the front end as well, unless the stations you want to listen to are very close and strong.

The best approach would be to hit the local parts house for a 20 MHz crystal oscillator (e.g., a TTL-compatible 5-volt clock module for computers), and use it in conjunction with a simple one-transistor mixer circuit. See the ARRL Handbook or any of the Markus "circuit reference" books for any number of workable circuits. The mixer will convert the bulk of the US FM band, from 90-105 MHz, to the 70-85 MHz range of your tuner.

Construction would not be especially critical, as you wouldn't be trying to build anything with any real gain. Quite a bit of loss would be tolerable unless you're trying to pick up stations in their fringe area. You could use broadband transformers at both the input and output, and the only real consequence would be susceptibility to interference from air traffic control on the high side of the FM broadcast band. This would happen only on certain frequencies, which probably (hopefully) wouldn't coincide with the ones you're interested in listening to.

You *might* even be able to accomplish your goal by simply feeding the 20 Mhz crystal clock directly into the FM radio's antenna terminals, through say a .01 uF capacitor or something similar for DC isolation. Those things put out a pretty strong signal, and non-linear mixing artifacts due to your tuner's front end design might well finish the job. Probably worth a try, before going to the trouble of building an outboard mixer.

Surely you know that, in the U.S., TRANSMITTING on a radio that is not approved by the FCC for that specific radio service is illegal. Just because a radio is approved for ham use does NOT automatically make it legal for any other radio service, including FRS. You may verify this with Yeasu.

Just a hint that you may want to be more careful about including your name, etc. when you may be violating a law.

FWIW - Over here it's illegal to listen to anything other than 'authorised' frequency bands. But 'blind eyes' are turned to things like Aircraft band (in fact, I'm told that frequencies are displayed at airshows!)

Also, the police have started to encrypt much of their transmissions to make things more difficult for evesdroppers.

The penalties? Well not 'a year in the slammer' but fines, confiscation of equipment and revoking any licences to transmit etc., that you might hold. As if that might stop some people.......

It's not only illegal to transmit out of band, but also to instal (various legal definitions of this abound!) for use, even on receive only. So just having the gear can sometimes be taken as an offence, even if you fully intended (so you say) to convert it to amateur bands. This last one causes *much* excitement in the Amateur ranks in this country ;-)

Oh yes, and single band 10M gear is totally band from sale or import! Just in case it were to be converted for illegal use on 11M. As if there were not enough to go around anyway, if you were to know where to look. Which I don't, of course, not that I would want to anyway. I was an illegal CBer a long time ago now (oops, that's blown my Amateur Credibility, if I ever had any!)

Hello Roger and Marjo:

Some thoughts to your excellent questions.

First, you might indicate what the source impedance is. I'm presuming it is 50 ohms. Then your projected SWR is about 3:1, if your load impedance calculations are correct. That sounds a bit high to me. In my experience a "dipole" that is an odd-multiple of 1/2 wavelength is usually under or nearly 2:1. The impedance numbers you give as a function of antenna length are suspect to me. A center fed, one wavelength antenna should have a feedpoint Z in the order of thousands of ohms. Certainly, 90 ohms is incorrect, if the antenna is center fed. You only get low Zs on such antennas if the antenna length is an odd multiple of a half wave. (Basically, a half wave has high current, low voltage at the center, as do all odd multiples; even multiples of a half wave have low current, high voltage at the center. Ohms law thus leads us to conclude that odd multiples have lowZ center feeds and even multiples have highZ center feed points. Z=E/I)

The RG213 is overkill at 7 meters in length and the SWR projected. You need it neither for being able to handle the voltage from the SWR (you said low power) nor for keeping losses low. And, it will be quite heavy, weighing down the center-fed, long antenna. If you can find smaller feedline, it will likely do as well.

You could use your tuner for transmit as well as receive to match the load to your transmitter. True, the SWR of 2-3:1 will be present on the feedline, but given your line length, I don't believe you'll notice much loss. Of course this suggestion only if your tuner is designed for transmit at the power levels you're planning.

Another alternative would be to stub match the 50 ohm line to the antenna. Unfortunately, this would work well only for the one band.

You can design coaxial matching networks (baluns) of any ratio. I've seen articles to that effect, I believe, in QST. You might check some of the internet ham pages for antenna design programs. One of them might have what you're looking for, given that you don't mind some home construction. There's nothing magic about baluns only being 4:1 or 1:1!

You didn't mention much about the transmitter. If it's an old tube-type transmitter, it will likely be able to load up a 2-3:1 load. If it's solid state, forget it. Most of those are designed quite narrowly.

Good luck.

Hi Robinson OM,

Do not use PVC as a dielectric for a capacitor. It has very high RF losses. Thin Teflon sheet is excellent, air is better, and vacuum is ideal.

>has such item)
Any use to use a Radio Works T4G line isolator ?

Well thanks
>for reading this. And I would be very pleased with your
comment.

Kind
>regards,

Roger Willems
The Netherlands

Well, Roger, I have used a 40 meter dipole on 15 meters with a regular 1/1 balun and with no balun at all and no tuner. It seems that a dipole antenna that is an odd multiple of 1/2 wavelength, such as yours, still has close enough to a 50 ohm load to need no matching appliances or circuitry for 50 or 75 ohm coax.
By the way, while a free-space dipole has a theoretical impedence of 72 ohms, your antenna will have signivicantly less due to proximity with the ground. I bet it will be around 60 ohms especially since one end is drooping somewhat. This is close enough to not bother with trying to construct a special balun.

You are using a short run of relatively low-loss coax. Your line losses will be pretty low with any decent match at all.
Make your antenna about 3 feet longer than your calculations call for. hook a SWR meter up between your transmitter and feedline. Transmit a test signal on the frequency for which you want to optimize the antenna. Observe the SWR. Shorten the antenna a bit by doubling up a foot or so on each end and see whether the SWR improves or worsens. Do the same on both ends. Do whatever is indicated by the results, in small increments, until you acheive a 1/1 or thereabouts SWR. Since your antenna should resonate with an impedence fairly close to 50 ohms, this will indicate a resonant or nearly resonant antenna. This approach will give you better results than trying to calculate things out to 3 decimal places and put it up, expecting it to work perfectly. There are many factors involved with your antenna that very nearly defy calculation anyway, so it is easier to estimate with the formula and a little extra lengthn then cut and try.
You do not need a 1/2.2 balun. You might not need any balun at all, but if you do you can use a regular 1/1 device either homebuilt or commercial. There are a couple of techniques that you can use in place of a real balun... either slide ferrite beads or toroids onto your feedline at the antenna feedpoint, varying the nimber to find the most effective number, or simply coiling about 10 feet of coax into about an 8 inch diameter coil at the feedpoint. These techniques do not give you a true balun, but they do act as a choke attenuating return current down the coaxial shield. I have used the coil method with fairly good results.
You will probably find that you have reasonable performance when receiving out-of-band with a tuner, and in fact you can probably transmit fairly well on various ham bands should you ever get a license. The low feedline loss combined with a tuner for a good match to the transmitter will enable at least SOME signal to radiate from your antenna at most frequencies.
Good Luck, Roger, and please re-post with the results! When we see a new ham or anybody else in need of tech help, we like to see whether in the end any advice given did in fact solve the problem. Please post a followup... it helps encourage hams to continue to offer help to others.

Naah, I'm just still overwhelmed with doctorate (ministry) work and can't even make the time to get the necessary 230 line run into the shack! It was easier to do the trade and get the gear up and running. Sure appreciate all of the help! I learned a lot! 73, DavidC AA1FA

assure you that I am not planning to start my own TV station. I
merely
>wish to learn more about this technology.

Thanks.

Aaron, your "broadcasting" might not be illegal. At micro-power levels,
transmittling on almost any frequency is aok by the FCC. Generally, I believe
this power level is 100 mw effective radiated power. One caveat though is that
generally if you cause interference with an unlicensed device to another
legitimate LICENSED service, you are at fault. So, I urge you to use only the

power necessary to do what you gotta do. Also, if anybody asks, stress the EXPERIMENTAL aspect rather than the utilitarian one of your project.

A R/O I sailed with a while back rebroadcast the AFRTS subcarrier from the 1691 MHz or whatever it is signal from the INMARSAT satellite all over the ship. The deviation characteristics of the signal were those of the normal narrow band AFRTS FM downlink, and so there was a lot of noise in the signal when received by an FM broadcast receiver. Nevertheless, those either not SWL inclined, or those who liked the AFRTS programming (Yiccchhhh!) listened to it.

The "Transmitter" was a television pre-amp such as you buy at walmart for a few bucks. He just turned it around backwards, I guess you would say, and fed it to an old VHF log-periodic TV antenna. The signal was audible anywhere topside.

Try the pre-amp trick. Use a 3 or 4 foot piece of wire for a transmit antenna, and cut the wire back until the signal is too weak; then increase the length again until it is just satisfactory. Then visit the neighbors and make sure your signal does not interfere with ANYTHING. Ideally, they should not notice any signal at all on their sets when tuned to your VCR frequency, probably VHF channel 2 or 3.

There are commercially available setups designed just for what you want to do, with various price ranges, but do it yourself and you will save a few bucks and learn something about RF.

Note... If your signal is copiable on TV sets outside your house, not only do you risk being in violation, and getting the neighbors very very mad at you, but you might also incur the wrath of the MPLA. This is not a revolutionary army, though the acronym does sound rather menacing; it stands for Motion Picture Licensing Association. Your storebought or rented videos are for private, home use only, and you will be broadcasting them without a license agreement with the MPLA, which collects licensing fees and royalties for virtually every video producer. They will be more likely to ream you than the FCC.

So with all these warnings and hints, have fun, but do be careful.

Let's see how well you do on your own in outer Rangoon, KemoSabe .... ;0)

>Masa would still be the town clown if he could copy Morse code at 50 wpm.

Are you kidding? He'd be embraced by the pro-code zealots as a god!

>He enjoys playing the fool ...

How do you know? Have you asked him lately?

> ... - the difference between you and Masa is he
>realizes he's a fool. ...

You claim Mr. Masa is a fool, and you claim Mr. Masa knows this:
1.) You seem to make the claim simply on the basis of Mr. Masa's
(in your view) clumsiness with language, and apparently for no other
reason.
2.) Again, has Mr. Masa communicated to you this supposed "realization"?
3.) IMO, the one who appears to be the "fool," the "jerk," and the "town
clown" is the brash, snootishly arrogant one who makes those claims
for others not like, or perhaps "as good" as himself. ;0)

> ... You could turn a church sermon into a no code debate,
>Squiggy.

If the sermon were on equality, fairness, and level playing fields, I'd say
Carl would be close in using this debate as an analogy. Of course, let's not
forget the main reason for the "church sermon," assuming the "church" you refer
to is non-Morseodist.
Now if the "church" is Morseodist, I'd say Carl would definitely turn the
sermon into a debate ... and probably get bodily thrown out the front door as
well! ;0)

>
>You aren't interested in ham radio - you are only interested in making noise.

IMO, there are many aspects to ham radio, even yours -- Belittling the
efforts of those who attempt to make Amateur Radio better, even if only in a
small way.

>
>You are bitter because you haven't gotten anything out of ham radio because
>you haven't put anything in to it. You are very confused.

It seems apparent that you don't read much, or at a minimum, do not
comprehend at all well what you read : Carl has many times referred to and
narrated his experiences in Amateur Radio, which, as I (and most people)
intrepret them, have brought and continue to bring much satisfaction his way.
IMO, it is someone else who is confused -- not to mention brash, arrogant,
holier/better-than-thou, and (not in the least) more perfect.

>don't want anybody else to have any either.

Wow: THAT sounds exactly like the pro-coder attitude to me! =0)

>
>You have been a technician class ham radio operator for 25+ years. Nothing
>about ham radio ever excited you, intrigued you, got you interested. ...

Your assumption/assertion: Perusal of past WA6VSE posts/follow-ups indicates
otherwise.

> ... But you
>did notice along the way that other people in ham radio were having a lot more
>'fun' than you were, and that pissed you off.

Your words: Can they be substantiated? Or are you simply attempting to
start the new year off with a bang by laying a massive troll in front of Carl?

>
>So then along came the no code tech license, no code international, usenet, and
>there you were, pissed off, just waiting to jump on the band wagon and see if
>you could help flush the toilet. ...

Well, ya gotta admit, flushing the mandatory Morse code test down the toilet
ain't such a bad idea -- at least not in my book! =0)

> ... You always wanted to be a HERO instead of a
>ZERO, so here you are typing, in hopes of confusing the sheep.

Excuse me? Who's confusing? It seems to me one of the master obfuscators is
at work here -- and I don't mean Carl or myself. ;0)

>
>You have ZERO excuse for being a tech, Squiggy. ...

Slamming the techs again: Tsk, tsk. I'm a Tech+ and I feel fine .... =0)
What is so satisfactory, important or meaningful about being able to beep
fast -- simply from the regulatory point of view? Beeping fast, IMNSHO, falls
into the same category as contesting, DXing, ATVing, QRPing, DIGITALing, et al,
i.e. from the regulatory standpoint, there is NO justification for testing --
other than for knowledge of technical aspects, what other mode/coding/decoding
scheme is tested for? From the personal and operational standpoint, there is
EVERY justification for usage, development and implementation.
And, where in Part 97 is it written that one must upgrade? I believe that
requirement was dropped some time ago -- though IMO there are still those who
think that's the way things STILL work (or at least wish they did) -- they
cannot -- nay, WILL NOT -- get out of the stagnating swamp of status quo!

> ... You have expounded many times
>in the last two years how much you know about electronics. And a few times you

Hi! and sorry about the topic.

Does anybody know where I can find a shareware Assembler for these
wonders (8751/52)?
I am working with PICs but would like to try something more "friendly"
regarding interruptions, timers, number of I/O pins, memory, UART etc etc
etc... by the way, I really appreciate PICs, they are almost indestructible
as far as I tested.

Don McPherson <bjmcpher@usit.net wrote:..Al, you can use 110
stuff....etc.

Bad choice to use 120 volt stuff on 240 circuits. This mentality
reminds me of people who drive without seat belts, for whom stopping a
stop signs and red lights is optional and put up placebo smoke detectors
to pass a safety inspection (I've already seen that one too.)

At "The Home Depot", 240 volt outlets are only $1 or 2 more than the
120 volt variety in each category (i.e. 20 amp 120 volt rated stuff vs.
240 volt 20 amp rated stuff in the same brand). Wiring 240 to a 120
outlet will cause problems with insurance and liability issues as well
as simply being ill advised from all safety considerations. The argument
about a child sticking something into a 240 outlet is somehow more
dangerous is bogus. Both 120 volts (110) will kill as easily as 240
volts. I had a friend who is now 6 ft under because he did something
stupid with 120 volt wiring (He knowingly left off a ground wire in an
outlet box). For the sake of a few dollars, use the correct hardware. If
using a plastic outlet box, make sure that the ground wire from the
house wiring (e.g. Romex) is bonded to the outlet ground screw.

Outlets that look like below are 120 volt 20 ampere.:
(NEMA 5-20R)
| |
(neutral) ------| | (hot)
| |
0 (ground)

This outlet can take regular 120 volt (15 amp) plugs as well as 120 volt
20 amp plugs. Note that the slot on the left can take a vertical or
horizontal blade.

Outlet receptacles that look this:
(NEMA 6-20R)

|
(hot) | ------- (hot)
|
0 (ground)

are 240 volt 20 ampere rated. Note the only difference is whether the
left or right side looking at front of the outlet is across or vertical
or reversed. One with both blades across horizontally is 240 volt at 15
ampere rating. If you are using 12 gauge house wiring, you can use

either 240 volt flavor. Any store that charges allot more for 240 volt outlets vs the 120 volt is just ripping you off because they cost the dealer almost the same. Buy it at home center that buys large quantities. Don't be lazy or unsafe and use the right parts. Why take chances

> FWIW - Over here it's illegal to listen to anything other than
> 'authorised' frequency bands. But 'blind eyes' are turned to things
> like Aircraft band (in fact, I'm told that frequencies are displayed
> at airshows!)

When I was in Germany (ten years as a DOD employee), I decided to buy a Kenwood shortwave receiver from a local store (hey, the exchange rate was good at the time). It had huge chunks of the shortwave bands blocked out. The dealer had to send it to the Kenwood service center to have the bands restored (as an American, I could purchase the receiver with all the frequencies intact).

When the dealer got it back, he spent a couple of days listening to what he was missing (with my permission - he had loaned me another receiver). When he finally gave me the receiver, you could tell he was envious (he handed me the receiver like he was giving up a baby).

When I bought a scanner, he absolutely had a fit. This time he ordered one from the factory with all the frequencies intact (for his American customer - as he was calling me by this time).

I thought I would never get that scanner from him (I felt like I actually had to pull it from his hands). Then he would not let me leave the store until he had listened some more to the "banned" frequencies. This time, he was like a little child - I actually expected him to start jumping up and down with joy.

I'm going back to Germany (the same town) in a few months (yes, I'm still with DOD). Wait until he has a look at some of the stuff I have now. He's going to want to live in my radio room.

> Oh yes, and single band 10M gear is totally banned from sale or
> import! Just in case it were to be converted for illegal use on 11M.
> As if there were not enough to go around anyway, if you were to
> know where to look.

Ask some of the American military personel stationed over there. They can order 10m radio equipment from the US. Of course, selling it to you (without paid customs duties, etc.) is absolutely illegal. And if single band 10M gear is still totally banned, I seriously doubt you would want to visit the local customs office to pay the duties on such a radio.

> Which I don't, of course, not that I would want to anyway. I was
> an illegal CBer a long time ago now (oops, that's blown my Amateur

> Credibility, if I ever had any!)

Oh, how could you? A Cber, and an "illegal CBer" at that. Your credibility has dropped to an all time low in my eyes. ;-)

Very sorry if I'm addressing this question to the incorrect NG. It looks like you are all heavy HAM operators/builders, etc., so this request for help will be juvinile compared to the topics I've been reading...

I simply want to 'jam' a commercial FM broadcast radio station (i.e. over-ride 97.1Mhz). I only want to jam the signal for about a 100 foot area. Short durations, not more that 10-15 minutes at a time.

(When I say jam, I really mean just making it unlistenable. I'm not looking to broadcast a clear signal on top of it, but simply mess it up.)

I've tried wireless FM microphones, but they aren't powerful enough to broadcast on an existing station signal.

I've also built a 15 dollar FM radio microphone kit, but the kit mentions that it works best on old dial type radios since it won't lock on any one frequency very well. It didn't do the trick either.

This is, of course, for experemental reasons.
(Actually it's for a neighbor that insists on playing the radio, loud, with lots of bass, at horrible times of the night. -They don't play CD's too often- just the radio, and I just want to confuse them a bit ;)

Please email me with any info a budding electronics newbie could find useful. (aozminski@dsw.com or remove nospam from the reply address.)

Thanks!!!

Horowitz and Hill (Art of Electronics) suggest using a simple pull up resistor or a level translator chip to accomplish this. In the case of the pull up, they indicate that the smaller the value of the resistor the faster it will be but with increased power consumption. My question is, what works well here and what frequency limitations can be expected? I'll be running at about 3 MHz max into the clock input of a 4026BE with a 12V supply which can handle at least about 6 MHz. The 4026 will be driven from a 5V HCmos chip. Thanks for your help.

73,

Ron (KA3J)

Yesterday I got hit with a very high power surge. Fried a few appliances, but my computer, which was downloading a file on the Internet at the time, has survived.. So far at least.. My EFI Surge Suppressor wasn't so lucky. It is warrantied, but I think I can repair it cheaper than I can send it from Canada back to EFI. Anyways, it's too late now as the power suppressor's board is in my hand ;) Hey, I'm a ham.... I *had* to see what was in there..... hi hi

There is a D-BiDir Surge Clamp/Over-Volt Trans Sup, 130.8VAC RMS, number 1.5KE220CA, which I think the smoke has escaped from. How do I test this? It shows 0 ohms both ways.

More than just a radio is needed for GSM. GSM is a digital technology
(a form of TDMA). Some sofisticated hardware is needed to decode the
bitstream into audio. In the US AMPS and NMT in northern europe are
easily intercepted. (just FM analog).

Aaron, what you want to do is strictly illegal and might get you into trouble. Don't touch this! You can do a lot of mischief on the air and get away with it, but intentional malicious interference with a licensed service is a definite no-no. I'm not coming down on you or anything... I just don't want to see an inquiring mind such as yours get itself into trouble when there are so many, many more productive outlets for the creative and experimental urges.

If you really want to tinker with radio, buy some books and build a receiver. Better yet, get your ham ticket and build a transmitter to go with the receiver, and get on the air using responsible and considerate operating practices.

What is more interesting... driving your neighbor crazy until he or local hams find you out and get you into hot water with the FCC, or discussing antenna design with a ham in Turkmenistan? You can DO it! You can easily acquire the skills and knowledge you need to get on the air in a proper manner in your spare time of a few weeks. As you study for your first license, you will learn quite a bit about not only what is legal and illegal, but what is considerate and inconsiderate in the way of operating practices. You don't have to piss off the neighbors or pay a big fine to have fun with radio. Do the right thing! There's a whole world out here waiting to help you to get started and advance in the hobby.

writes:

>
Oh, how could you? A Cber, and an "illegal CBer" at that.
>Your
credibility has dropped to an all time low in my eyes. ;-)

Hi Hi Dwight You're not alone! I wonder how many hams have been on 11 meters with their HF rigs and have been too ashamed to tell anybody?

Intellectual curiosity got the better of me once, and I had (still have) a TS-50S that I had performed a "diodectomy" on for use (again, technically illegal) as a backup Marine HF CW rig... It was simply a better setup than the ship's gear, and a good lightning strike could easily take out the ship's station, but my personal rig was always disconnected and unplugged from everything around thunderstorms. The FCC guy (back when the FCC inspected ship stations) told the R/O there was simply no way he would be hassled for using his own identical rig on the air, since there is simply no easy way to tell from the coast station which transmitter the signal came from anyway. The R/O used HIS TS-50 on CW simply because it was a better rig, and split frequency pairs could be entered into memory and accessed at the touch of a button. It was an involved process going from a calling frequency to the working freqs on the ship's gear.

Anyway, I opended the thing up yet again and reduced the drive pot for the 10W power output so it only ran 4 watts at the 10 watt setting. I went on the air with an end fed wire, an L-tuner, and plenty of radials all over my apartment. The relatively efficient (compared to a stick mounted on a pickup truck mirror) antenna, along with superior modulation and audio qualities, simply blew people away, and I had to further reduce the drive to I think a 1/2 watt. At 4 watts I was asked where I got the linear!

I assumed, correctly it would seem, that the FCC had other things to do than hassle a considerate operator using legal power and transmitting a nice clean signal on 11 meters. The only reason I was illegal was because I could tune the thing off frequency, though I can't for the life of me figure out why I would want to do that.

Anyway, though it was in fact illegal, I went on the air several times, and got into a lot of discussions with CBers who were genuilely curious as to how I could sound so good with a half watt signal. I explained a lot about radio, especially antenna design principles that any ham knows by the time he has a General. A lot of guys who had assumed that more power is better, came around to the idea that efficiently designed, adjusted, and operated equipment is more effective than brute force on the air. Hopefully, somebody out there got

interested enough to get a license.

I quit this illegal activity after getting a couple of air-flames. "Why don't you go back to the ham bands where you belong, if ham radio is so much better than CB?" was one remark I remember. I took that op's advice.

So, Dwight, that's MY confession. I did it. I knew that even though I followed good operating practices and stayed as close to being within the law as possible without building or buying a proper CB rig, it was still illegal. I promise not to do it again. So there... anybody else wanna confess?

Maybe you could get your radio dealer interested in homebrewing?

The wireless FM microphone of which I spoke earlier does exactly what I've requested. It is creating a signal on top of the existing FCC approved FM frequencies, however in very small wattage outputs. I made an assuption that I would use such a sysytem to accomplish my request, and it looks as if I have been mistaken.

I wasn't looking to break any FCC regulation, I assumed that since the rinky dink wireless FM mic's do it, I could up the power (within the FCC limits) to get the job done (100 feet).

I do understand the reluctance for many people to 'push these limits' and if this is an uncomfortable topic, my deepest apologies to this NG and I will once again lurk, and learn from your vast knowledge.

Thank you, Robert Lay and R Crusoe (especially) for a more intelligent and intellectual contribution to my situation, rather than the 'better-than' and childish response (which typically give NG's a bad rep.) previously posted from Clint Bradford. Clint, you are the idiot. My interests in amateur radio are deep. I have had a friend (KA7YRU) from Junior High School (Many, many, years back) that got me interested in HAM. Without the intellectual responses from other members in this NG, I probably would have taken what Clint said, marked amateur radio operators as jerks, and been on my way.

Because of R Crusoe, I believe I will further my knowledge and probably increase my active involvement in amateur radio.

Thanks everyone else for your time.

Can anyone tell me what I should pay (here or elsewhere on the Net or
Packet) or expect to trade in equal value, for 8877 sockets and chimneys?
Thanks!

Source record: 87588

So, Dwight, that's MY confession. I did it. I knew that even though I followed good operating practices and stayed as close to being within the law as possible without building or buying a proper CB rig, it was still illegal. I promise not to do it again. So there... anybody else wanna confess?

Sorry, i can't confess for myself, but i heard on our nightly net a week or three ago someone who had worked Australia from CM88 on 11 meters...

Source record: 87589

Grey code is a binary type code in which
each number (in sequence) only has a one bit
change from the number before and after it.
You can find the details of this code in almost
any digital electronics book, and in most electronics
books.

To see what a grey code encoder disk looks like
you can look in the same books, or even in a robotics
book.

The disk can be made with conductive strips, and
some contacts that touch the disk.

The disk could be made with clear plexiglass or similar
material, and the code could be painted on with some
opaque material... This would allow you to use an IR
LED and IR Receiver to use the greycode.

Other methods have holes drilled in the disk corresponding
to the grey code, and sometimes there are black and white
areas on a disk with a photosensor.

The point is: there are many methods.

265. Question: How to broadcast??

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-08 00:00:00 UTC
From: aweiss@pomona.edu
Message-ID: <34b42410.57938933@news.tiac.net>
Source record: 87667

I recently noticed that if I hooked up a "rabbit-ears" to my VCR, that I could broadcast the signal on channel 3 or 4 about a foot to a nearby television set. I then put a standard Radio Shack 10db 75-ohm coax amplifier (part# 15-1118B) inline before the "rabbit-ears" and it increased the range of the signal to about 4 feet.

I know very little about television and radio broadcasting, but I would assume that the antenna one uses makes a big difference. So, I was wondering what would be the best (read: cheapest) way for me to increase my broadcast range. Is an antenna the best way to increase range, or can I just daisy-chain these $13.00 10db amplifiers? Is there a single amplifier that would work well?

Also, is there a way to broadcast FM using some pre-made device in the same way that VCR's transmit on channel 3 or 4? And, if there is, wha is the best way to increase the range?

BTW - I realize that this activity violates some FCC rules, but I assure you that I am not planning to start my own TV station. I merely wish to learn more about this technology.

Thanks.

Hi.....

There is apparently an article on a 10M to 70cm transverter
in the "The VHF/UHF DX Book" edited by Ian White, G3SEK

I am looking for anyone who has built the 432 Mhz transverter
and could offer their comments good/bad/easy to build ????

Also if possible if someone is willing to photocopy the article for me
or scan it and email them to me in any popular graphic format.

It would be greatly appreciated.

The message <34B42B97.290@sccoast.net>
from Dwight Stewart <stewart@sccoast.net> contains these words:

Lots Cut

> Oh, how could you? A Cber, and an "illegal CBer" at that. Your
> credibility has dropped to an all time low in my eyes. ;-)

> Dwight Stewart (KF4URZ)

Hi Dwight, glad you enjoyed the message and I can guess that your
German friend enjoyed the radios!!!!

Yes, well, we all have skeletons! But if you own up to them no one
can blackmail you for them ;-)

In fact, being an ex-CBer can be a help. Sometimes newcomers join
the club or novice class and are appologetic about being a CBer. My
response is 'Well so was I, it's radio isn't it?'

So what if others cringe and bluster, it's what you do 'now' that
counts. How many do you know that were never 'CBers' but might as
well be now? (and I'm talking almost every band and mode here!)

OK - so here goes, at one time or another I have been active on the
following bands/modes (not an exhaustive list - everyone would get
really bored) :-

10GHz, 24GHz, 73kHz (Homebrew, of course)
Built own packet TNC from a kit
QRP on 2M/6M and, sometimes, HF - Using homebrew gear
Worked Aurora on 2M using 3 Watts
Worked Es on 2M and 6M - Usually QRP (including currently holding an
IARU distance record for 6M Es)

Not bad for a CBer? Oh yes, mostly CW op. as well!!

Funny Story = I was visited one day by another amateur, who I only
knew a little, and he was looking at the simple 10GHz and 24GHz
Wideband gear (very crude stuff!) and said "You'd never get one of
those CB idiots doing this, would you?"

I said nothing, opened a draw and pulled out a 'You have been
eyeballed by' badge. Funny, I never saw him again!

Never said that it was not a great rig. I had one for quite a while
and it performed wonderfully. Even after being dropped out of a truck.
But it was asked about mods for the radio. But, as you said,..simply
put it is a performer.. And is simple to operate.

Any probe good for 60 MHz bandwidth will work. Tektronix OEM probes seem to be the most reliable, but Probe Master and other brands are fine too.

******** GUARANTEED! GUARANTEED! GUARANTEED! ********
A FABULOUS NEW & PRIVATE $$$ CLUB WILL CREATE
200 MILLIONAIRES IN 12 MONTHS!.............
YOU CAN BE ONE OF THEM IF YOU TAKE ACTION NOW!
$$
$$ TURN $25 INTO $1 MILLION IN 12 MONTHS!!! $$
$$ (all you need is just 10 people to do it!) $$
$$ and $$
$$ WE'LL EVEN RECRUIT THESE 10 PEOPLE FOR YOU!$$
$$
If you're still searching for that PERFECT OPPORTUNITY to come along
...SEARCH NO FURTHER!!!
THIS IS IT!!! By reading this message, you're cordially invited to
take part in a REAL OPPORTUNITY, with REAL PEOPLE & REAL MONEY!!!
Your only requirement to succeed is just follow simple instructions.
****** YOUR NO RISK GUARANTEE ******
What's more, I'll personally GUARANTEE your complete success in this
incredible opportunity. If you don't generate A REAL INCOME by
following instructions, I'll personally refund your $25 - a small
one-time-only cost to activate the program. You've absolutely nothing
to lose but everything to gain.
As a matter of fact, since we'll recruit your 10 people required by
the program, the worst you can ever get out of this unsurpassed
opportunity is your $1 MILLION! And the CLUB will make sure of that!
****** THE KICKER IN AMASSING GREAT WEALTH ******
Imagine...having 10, 100, 500, 1,000 or more people who will send
you $25, then $100, then $350, then $1,500, then $6,500 on a regular
basis and loving every moment of it!
When you receive your 1st $25, you'll have recaptured your small
investment. This will be THE POINT OF NO RETURN for you because any
rewards after that is PURE PROFIT for YOU!
Have you seen or heard of any business opportunities or network
marketing programs on the Internet even come close to duplicating
that??? If you do, LET ME KNOW - I'll be the 1st to join!
If you're a heavy-hitter/go-getter, it'll be an easy task to recruit
10 people in a couple of days. But since most of you are not heavy-
hitters, would you like to get EVEN FOOTING WITH THE BIG BOYS by
tapping the powerful FREE PROMOTIONS/ADVERTISING available on the
Internet? We'll show you HOW!

***** SECRETS TO SIGN-UP EVERYONE YOU KNOW - EFFORTLESSLY! *****
How about an EFFORTLESS recruiting technique that will have almost
everyone you know be lining up to sign-up...so they, too, can get

some of this wealth & success that you're getting? No need to hard sell anyone and ended up losing your friends or relatives! You'll be able to recruit as many people as you want to MAXIMIZE the UNLIMITED POTENTIAL of this once-in-a-lifetime opportunity!
***** YOU CAN'T FAIL - RESULTS ARE GUARANTEED! *****
However, if for some reasons that you do require some help in getting your 10 people (minimum required by the program), the Club's National Advertising Campaign will do just that for you.
YOU SIMPLY CAN NOT FAIL ONCE YOU'RE IN THE PROGRAM!
Just email me and request "HELP" with your I.D.# after you signed up, and I'll email you the instructions. (note: you must be a member & have your application on file at the Monitoring Office before HELP is provided)
There you have it! It's A REAL OPPORTUNITY & IT WORKS JUST LIKE IT PROMISES! NO MONTHLY PRODUCT PURCHASES, NO SELLING, NO RECRUITING (unless you want to), NO MEETINGS, NO WORKS! PERIOD.
It's automatic & effortless...IT'S FREE INCOME to enhance your life style & comfortable retirement!!!
It's better than any network marketing program you've seen, heard, or involved to this date!
But you don't have to take my word for it...check it out for yourself by visiting our website at the following address:

Jacques,

A pad is a pad (no hole). Looks like you want to select a 'via'
using EasyTrax. As I recall, easyTrax will allow you to size
the OD and ID of the hole for the via.

Of course if you have some other reason for a hole in a pad
(such as a really big pad with a really small hole) you could
assign a hole to be drilled in the center of your pad.

Good luck,

Shawn WB6JWB

Gday
I am considering doing just this with a AD9850 DDS chip which is 28 pin SSOP (about half mm spacing) I will get the board made up by the local PCB manufacturer so that it is tinned but not solder masked . I presume one just squeezes some solder cream on the board and wipes it to get a thin layer and places the IC before blasting it with hot air from a heat gun. Anyone got any comments?

Richard

Yes you can. There are a couple of important factors to observe in construction of this type of antenna. First, the radiation resistance will be very very low, so it is essential that loss resistances be kept extremely low or the antenna will have very poor efficiency. Use a large diameter conductor for the main loop, and don't depend on mechanical connections, solder or braze all joints. Use of 1 inch diameter copper water pipe is about the minimum size for the loop conductor, bigger is better. And realize that the voltage across the loop capacitor will be *very* high at resonance. You'll need a capacitor which can handle at least 10 kV to operate at the 100 watt level. And connections to, and internal of, the capacitor have to be very very low resistance. Use of a split stator design is highly recomended to avoid the resistance of a rotating connection.

There have been construction articles in QST and in the Antenna Books for this sort of antenna. And Reg Edwards has a loop design program on his website.

Try the Antenna Book. There is a good article on small loops which should answer all of your questions. Hal, W9UYA

Heres a paste from a post replying to a request for help on a tuning capacitor for such a loop. I remember the article, and it is definitely a wortthwhile, doable project if you need such a loop and don't mind its shortcomings.

Sorry, I don't remember who first posted this. I pasted it into my scratchpad .txt file I keep in the corner of my screen for saving such tidbits of information. I don't take credit for presenting it.
////////////////////////////
-On article along these lines is ' A Homebrew Loop Tuning Capacitor', Bill Jones, QST, Nov 1994, pp.30-32, with construction details of a 100W loop and U-shaped capacitor.

Most municipalities have a law that requires a person to abate their stereo's,tv's,and genereal disruptive noise after 10:00pm. if they are that disturbing to you, why not go about quiting them down legally? Call you local police! That is what they are there for. They also keep track of the number of calls to a certain residence, and will issue a citation if enough complaints are received.
Are you sure you don't have an ulterior motive here that you are forgetting to mention?

First of all, Brian, low powered FM broadcasting is perfectly legal. That said....

I see you have changed names again, Brian!
Did you get too much heat posting under "Mr. Dxer" and "Moving Sale" ?
Now you insult using the name "Angus".....

Really, Brian, if you continue to insult people in this and other newsgroups, and then try to sell something, get info or get help with a project, your going about it the wrong way. Changing your name in the "From" field of you newsreader does not change your identity. You are easily identified through various sources on the net, and until you stop the garbage you have been spewing, no one will take you or your post's seriously. You are simply showing how childish you really are. Stupid, insulting and snide comments to other post's are simply not called for, and do nothing but degrade the newsgroups that you post to. BTW, how come you never post this garbage to <nj.forsale> ? Hitting a little too close to home? Or how about <rec.radio.amateur.antenna> ? Maybe you like talking about antenna's too much to piss off people in that group.

Why don't you reply to this post in a civil manner and try to explain to the folks here why you do this? Do you really have the nerve? Or will you send me a private e-mail like you did last time, spewing nothing but expletives? Considering your track record here, I expect the latter... But if you flame me privately and refuse to respond to the group, I will post your response here so everyone can see what you are made of.

So for those who have been abused by your uncalled for fodder:

Due to the FM capture effect, one would probably have to run some
illegal power (beyond an FCC part 15 subpart B field strength limit) to
overcome an FM Broadcast where the signal strength is high. Also, there
is no way to control how far the blocking will occur. Additionally, any
malicious interference carries some heavy Federal fines if someone gets
nasty and wants to bring action (like the effected broadcaster).

Try 1/10 watt, Chris. I believe that is the maximum poweer level you can legally use. There are kits and even some ready to run units sold by Ramsey and others. They range from under $10 to a couple hundred in price, and you get what you pay for.

Keep in mind that even if the output power is within legal limits, and no indecency or copyright violations are transmitted, you still can find yourself in trouble if you interfere with any licensed activity on the air with your unlicensed station, so pick a nice clear frequency.

Ramsey has a fairly nice synthesized kit with the frequency programmable by internal DIP switches, which is all you need... once you pick a frequency, there will be no need to ever change it unless a licensed station picks your freq for their operation. Cost is $129.95 in this catalog I am looking at, which is a couple of years old. There is a nice looking little speech processor that will give you a bit more punch and clarity that costs $59.95 without the case. They have a VERY nice little transmitter kit for $249.95, but frankly I think it is more than you need. Besides, unlike most of their kits, I suspect that a fair amount of technical skill and building experience are needed to tackle this kit. There is a ready-made antenna, it looks like some sort of J-pole, available for $39.95 for those who know nothing about antenna design and simply can't be bothered by it. In a pinch, you can use a regular log-periodic VHF TV antenna, but your signal will mostly be going in the diredtion the antenna points, and will be pretty weak in other directions.

Note... the catalog offers power amplifiers that will increase your power to a watt. I do not reccomend your using them, especially if the legal limit proves sufficient, which I am sure it will with proper antennas, feedlines, audio sources, etc.

There are other suppliers ofsuch equipment, and you can certainly design and build from scratch if you are tecnically inclined in the least. There is plenty of literature around on FM transmitters for VHF.

Check around... you might even have a ham in your church. If nothing else, you can twist his arm to check out your setup after YOU build it. He will at least be able to tell if you have a proper ground, and if your antenna SHOULD work.

Have fun, and learn.

301. norcal 2n2222 X 22 xceiver ideas

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-09 00:00:00 UTC
From: Pushpendra S Khaira <singhpk@ix.netcom.com>
Message-ID: <34B63E68.5DFD@ix.netcom.com>
Source record: 87610

hello guys,

Any ideas as how to build a HF QRP tranceiver using
upto 22 2n2222 transistors and NO ICs.

I guess i would like to start by using the following as building blocks.

I think I would target the 40 M band first and use an IF freq of 5.2 MHz
or 9 Mhz

2 transistor + 1 zener VCO at about 12 to 12.3 MHZ OR 16 to 16.3 MHZ.
This could use a 1 transistor as oscilator and another as a buffer to
drive the diode DBM mixer.

1 transistor + 1 balun core as a NFA broadband amplifier. This could be
used as pre/post mixer amplifiers.

An IF amplifier using 3-4 cascaded RC coupled 2n2222 transistors .
PIN diodes or IN4007 diodes can be used as attenuators for AGC.

An DBM and 2 transistor BFO can used as the CW or SSB demodulator.

3 transistor + 1 transformer can be used as an audio amplifier like they
used them in 20 year transistor radios. The output transistors are
connected in series and driven of 1 phase splitter transformer .(if
anybody remembers that configuration any more)

SO, 13 transistors have already been used.

1 DBM + 2 transistor xtal oscilator can generate the signal for the
tramit section. Maybe the same BFO oscilator can be used to serve
as transmit mixer oscilator.

2 or 3 cascaded 2n2222a NFA amplifiers using baluns could boost the
power level enough(50 mw) to drive the PA .

Having used 18 transistors, the remaining 4 transistors can be used
as PA to boost the power level to upto 4 watts.

I would suggest that the DBM mixers be homemade as well using 4 in4148
diodes and 2 balun cores like bln-43.

ALso, I would just like to use zener diodes for regulation of power to
the VCOs only, assuming that the Xceiver will be run of a 12 volt gel
cell power source.

I would like to hear your ideas about this possible implementation and
its feasibility. ALso any comments about the suitability or the lack
the same for using 2n2222a as VCO or IF amplifier or rf amplifier.

: Grey code is a binary type code in which
: each number (in sequence) only has a one bit
: change from the number before and after it.
: You can find the details of this code in almost
: any digital electronics book, and in most electronics

It's Gray Code and it simply changes one bit in every transition , ex :

BCD | Gray
00 | 00
01 | 01
10 | 11
11 | 10

Gray code is used in many digital systems projects .

100 milliwatts with a 3-meter antenna is legal in the *AM* band, not in
the *FM* band. The effective radiated power allowed in the FM band by
the FCC Part 15 rules works out to less than a tenth of a *microwatt*!

Most municipalities have a law that requires a person to abate their stereo's,tv's,and genereal disruptive noise after 10:00pm. if they are that disturbing to you, why not go about quiting them down legally? Call you local police! That is what they are there for. They also keep track of the number of calls to a certain residence, and will issue a citation if enough complaints are received.

Are you sure you don't have an ulterior motive here that you are forgetting to mention?

Alas, i'm afraid i can sympathize. We had a neighbor with a dog that would bark outside of our bedroom window for hours on end in the middle of the night. Sure, Aninal Control eventually dealt with the matter, fines were assessed and the dog was "de-barked" (surgically altered to reduce the sound level). But we had garbage thrown in our yard repeat-edly, we received crank phone calls traced to his office (but just not for long enough to be actionable) and my vehicle suffered a few hundred dollars worth of vandalism over the next few years, none of which could be proven. He landed in jail on at least one occasion for acts related to his alcohol consumption, and the police visited several times a month. We were probably blamed for alot of that, even though we only complained a few times during that period, and, yes, it was very loud music.

Do i approve of intentional interference? Of course not! Do i approve of hacking wars? No!! Do i have any other answers? Probably not unless you can either organize your neighbors or talk your police/sheriff into not disclosing the complaintant. Two things that you might try. First, see if there is a free mediation service available in your community. If you go through them and the offender refuses to cooperate, i expect you will get swift action from the local police and even the courts of it comes to that. If you don't want to go that route, you might discuss the matter with the local authorities during normal business hours, explaining your problem, any concerns you might have about retaliation, and ask how to best deal with the problem. They may just say, call the dispatcher when you have a problem, or they may be willing to deal with the anonymity issue if that's a concern for you, or maybe they'll have some other way of dealing with it.

Good luck!

Lyle, K0LR

Hmmm. Thanks Lyle. Maybe Chris needs to go AM, which wouldn't be too noisy during the day. Or maybe .1uw is more effective than it sounds. Anyway, the kits from Ramsey are claimed to be of legal output power.

By the way I forgot to include info on Ramsey...

793 Canning Parkway
Victor, NY 14564
(716) 924-4560
1-800-HOBBY KITS 1-800-446-2295

Most of their stuff is pretty simple and doable by the first time builder with little or no help. I used a 10 meter transmitter and DC receiver built from their kits in my early ham days. They worked first time, an admirable achievement for a kit built by a beginner, and I actually made a few contacts on this crude rig that cost a total of 60 bucks. I almost never get something to work first time but these were real no-brainers. just stuff parts, solder, clip, align, and plug it in.

> --Will White

Hi Will OM,

Considering how easily and inexpensively these loops can be built, I am amazed that anyone pays $300 for one. See ARRL Antenna Book, or many other sources for proven designs. Hart, K5QJR's design uses a convoluted two-turn winding for more a nearly omnidirectional pattern, if you are interested in a loop with minimal directivity. Make the loop as large as is practical; don't limit it to the 3 ft diameter that the commercial ones use in order to facilitate shipping. Your radiating efficiency will be much higher as a result. Hart provides good design data on loops of any circumfrence.

My Nokia 101 cell phone battery is giving me fits....

Would someone measure the resistance (yeh, ohms !) between the center two (of the 4 interior) inside battery contacts and let me know the value. (At room temp, and not while or shortly after it has been on charge.) Push the tab IN on the top of the phone to pop the battery off, and no, you won't loose any stored info...

Apparently the power management chip uses a NTC thermistor to determine when the battery is heating at the end of the high rate charge period to sense when to drop back to a trickle charge mode.....

FYI, mine is about 74K at 70 deg F., and about 200K after 10 minutes in the freezer.

Thanks

You store your Nokia in the freezer? :-)

I have a Nokia Model PT128 with "Nynex" on the face. It has the long thin battery on the back, is it similar enough to bother taking those measurements for you?

BTW: Does yours have that tiny little external antenna connector on the bottom? Any idea where I might get the connector, an adapter to something more common, or a piece of cable with that connector on one end (I'll rig up the other end with a proper jack)?

Thanks! DavidC AA1FA

It is better to install a Low Pass Filter before you meet
and talk with neighbors about your ham radio.
Designed / Built By JR KB5MER
6 Meter Low Pass Filter Models:
Model#1 Harmonic down 38 dB @ 75 MHZ
52 dB @ 100 MHz
58 dB @ 120 MHz
Handles up to 250 watts PEP $39.00
Model #2 Harmonic down 68 dB through 900 MHz.
Handles up to 2 KW PEP $60.00
* Insertion loss less than one (1) dB
*All part as built to with stand a 4 to 1 SWR
*All test were made into 50 ohm load
* Test made by Austin Radio Lab
Price plus $5.00 shipping & handling Con US.

Will - Yes it's easy, provided you can keep resistive losses down by using a thick element. My own loop (for 80m) cost about $30 to build (I already had the large variable capacitor required).

All the info I needed was on the web. See the links section of my Novice Notes Online page (URL below) for all the information you'll need.

> Roy Lewallen, W7EL

One IC variation Paul might consider is Philips' 74HCT9046A, which has several improvements over the '4046 (bandgap voltage reference for the VCO & no dead band in the charge pump phase comparator, IIRC). However, the '9046 isn't quite pin-for-pin compatible w/ the '4046, so Paul should consider obtaining a data sheet on the '9046...it should be available at Philips Semiconductor's web site (http://www.semiconductors.philips.com/ if memory serves).

Even with the improvements in the '9046, it's possible it won't be suitable for Paul's intended application, but like Roy, I'd encourage Paul to give it a try.

Just my $0.02.

if your FM transceiver does'nt have clean cw tone, it is not worth
thinking about further modifications, and I I would not believe it is,
several xtal controlled FM transceivers have bad carrier signal tone
even as unmodulated.

Why
>would I want to in a free country?

Dave

To keep it free, for one thing, and to keep the peace when violence or danger threatens, as it never seems to do with a cop around.

Freedom has nearly always though history came out of the barrel of a gun or at the point of a sword. Do you think King John signed the Magna Carta just cause he was a really nice guy deep down inside, and he was swayed merely by the humble requests of his beloved subjects? Do you think the American Revolution was actually just a series of cricket matches and the winner won? Maybe General/President Santa Ana of Mexico was so moved by our sincerity that he was compelled to surrender during the Texas War of Independence, voluntarily become a prisoner of war, and cede ove a half milion square miles of territory to the brand new Republic of Texas?

When only the government and criminals can have guns, and the people are defenseless, open to victimization by not so much their own government but also by vicious criminals that slip through the gears of justice to terrorize honest men and their families, something is dreadfully wrong. The biggest problem with laws that forbid the ownership of weapons is that since criminals by definition do not concern themselves with the legality of their actions, the laws only forbid the ownership of guns by those honest men who DO care about the law. This is a perversion and a travesty, and encourages perpetuation of such victimization.

"Where guns are outlawed, only outlaws will have guns"

The greatest deterrent to crime is not the miniscule chance of getting caught, going to trial, being found guilty, and having to go to prison. Far from it... The most powerful deterrent to crime is that a "victim" can shoot his assailant dead, dead, dead, so that he can never terrorize or brutalize again, and his raping, killing, theiving , mugging, pillaging days are over. His peers seem to get the message as well, oddly enough.

By the way, I apologize for my countryman about the "English Slave" remark. It had the ring of an insult to it and did not contribute much toward meaningful

discussion.

I don't think the actual value is too important, the PM chip looks for a specific *change* in temperature. Otherwise you would have to charge using a specific temperature range.

If you plot temp vs. time you will see a rise at the end of charging, i.e. the trace will show a 'knee'. The charger detects this & shuts down, usually to a trickle.

BTW (apologies if this is stating the obvious), if you replace the nicads, make sure they are replaced with cells designed for the same charging current. They are probably 'rapid charge' nicads which many nicad cells are not (e.g. 50mA / 16hrs for an AA cell). Otherwise they'll get very warm very quickly!

GSM isn't used just in Portugal, bot all over Europe, as well as in small parts of North America (Washington D.C. has a GSM cellular phone network for instance), and several countries on the Far East.

GSM is a digital cellular phone system which in addition encrypts the voice data to ensure privacy. Sure, you could receive those signals on any receiver operating at the proper frequency (around 900 MHz -- soon a new GSM band around 1800 MHz will be used too), but it would sound mostly like noise, and you would be unable to make anything out of it.

Cellular phone systems which can be tapped by radio receivers are older systems, which uses e.g. normal FM for voice transmission. In Scandinavia, for instance, the older NMT cellular phone system can easily be tapped, and so can various kinds of DECT (= "wireless phones") phone equipment - all that's needed is a radio capable of receiving the right frequency bands.

REPLY...

I only mentioned Portugal because that was where the original message came from (and where GSM was first mentioned). However, I was not aware that GSM had spread so far around Europe and the US.

The point I was trying to make in my message was that I had heard that some phones, and some repeaters, were still not digital, or encrypted, on some GSM systems (or at least that is what I have heard).

With luck, he might be able to hear these with a regular radio with the right frequencies (assuming such a repeater is nearby), but it would be very limited because most of the signals, on even those repeaters, would be digital and encrypted.

Of course, I could be wrong. All I have is second-hand information from a radio buddy in Germany (I am heading there soon, so have been digging for info about this type of stuff).

In case you haven't already got a response:

I think there was a circuit or two with the SBL-1 in Solid State Design
for the Radio Amateur (DeMaw and Heyward??).

Also, many of the major component manufacturers now have good web pages
with specification, application notes, etc. for their products. See

http://www.dolphinics.no/~khp/chipvendors.html

for a listing or try a search for Mini-Circuits.

We have several GE MASTR II VHF mobiles with the PLL exciter option. Currently set up on 15X.XXX, but will easily move down below 150MHz. These are 65W and 40W units. A couple of them also have UHS front ends. Speaker, mic, cable, head comes with each unit. Radios will be bench tested for functionality prior to shipping. If you want to build a 2m repeater, this is a great radio to do it with. Conversion instructions available. If intersted, please send e-mail to: GWORTH@IBM.NET and also copy ADCJR@AOL.COM (be sure to copy both, as one of us is frequently out of town). $100 + shipping, Postal Money Orders only and sorry but no CODs. Thanks.

Uh, excuse me; it all depends on what you call LOW Power.....anything
over
a certain field strength is ILLEGAL under current FCC BC rules...
(usually most FM kits, etc run less than 100milliwatts!)
Anything over that is NOT (I repeat) NOT legal under current rules

Bryan, from the "ATC-35" it looks like iy is a 35 mmf that can be used in an amplifier all the way down to 10 meters, that is not enough capacity.
Just a suggestion, either give the real capacity, or if it is only 35 mmf it is worth much less.

363. Improve DC transceivers for 80/40m (Weaver type)

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-11 00:00:00 UTC
From: la8ak@no.spam
Message-ID: <34b80bb4.61625@news.online.no>
Source record: 87482

Matjaz Vidmar S53MV describes Zero IF Weaver type transceivers for microwave bands in DUBUS info nr 3+4/97 and Weinheim VHF meeting 1997. Denys Roussel F6IWF describes phase type DC transceiver for 40m at Weinheim meeting (compendium) 1994 and 1995. F6IWF discuss the IM problems and explain why normal LC-filters are not selective enough for 40m to avoid overload from strong BC stns outside the ham band (7000-7100kHz).
IM problems is the reason for S53MV only made transceivers for 23, 13, 6, 3cm bands where one normally have few signals simultaneously.
F6IWF uses a Murata SFE 7.02 MC ceramic filter to improve selectivity, and with this one will have satisfactory sensitivity up to 7130kHz and above 7150 attenuation becomes more important and broadcast signals are attenuated significiantly. His project is realized for DEM100.-($60.-). Sideband suppression for RX is 46dB and for TX is 35dB.
With the Weaver type better sideband and carrier suppression is achieved.
It seems fairly easy to build equipment for any band, but dynamic range for RX is critical, it is simply not possible to use RF gain to reduce signal level, some 40dB minimum dynamic range is considered important for the audio stages in rural areas.
Whether a construction is possible or not depends on available ceramic filters to improve front-end selectivity. So far I only know the available ceramic resonators for 3.58 and 7.02MHz. The 3.58MHz resonator is easily tuned 3.498-3.630kHz, so it might cover 80m cw band, but LC-filter may seem adequate(?)

if your FM transceiver does'nt have clean cw tone, it is not worth
thinking about further modifications, and I I would not believe it is,

several xtal controlled FM transceivers have bad carrier signal tone
even as unmodulated.

Jacques Brodeur wrote:
>
> How do we make holes in pads appear in easytrax plotting of PCB
> Thanks de Jacques VE2EMM

Jacques,

A pad is a pad (no hole). Looks like you want to select a 'via'
using EasyTrax. As I recall, easyTrax will allow you to size
the OD and ID of the hole for the via.

Of course if you have some other reason for a hole in a pad
(such as a really big pad with a really small hole) you could
assign a hole to be drilled in the center of your pad.

Good luck,

Shawn WB6JWB

It is better to install a Low Pass Filter before you meet
and talk with neighbors about your ham radio.
Designed / Built By JR KB5MER
6 Meter Low Pass Filter Models:
Model#1 Harmonic down 38 dB @ 75 MHZ
52 dB @ 100 MHz
58 dB @ 120 MHz
Handles up to 250 watts PEP $39.00
Model #2 Harmonic down 68 dB through 900 MHz.
Handles up to 2 KW PEP $60.00
* Insertion loss less than one (1) dB
*All part as built to with stand a 4 to 1 SWR
*All test were made into 50 ohm load
* Test made by Austin Radio Lab

Price plus $5.00 shipping & handling Con US.

> Roy Lewallen, W7EL

One IC variation Paul might consider is Philips' 74HCT9046A, which has several improvements over the '4046 (bandgap voltage reference for the VCO & no dead band in the charge pump phase comparator, IIRC). However, the '9046 isn't quite pin-for-pin compatible w/ the '4046, so Paul should consider obtaining a data sheet on the '9046...it should be available at Philips Semiconductor's web site (http://www.semiconductors.philips.com/ if memory serves).

Even with the improvements in the '9046, it's possible it won't be suitable for Paul's intended application, but like Roy, I'd encourage Paul to give it a try.

Just my $0.02.

Never said that it was not a great rig. I had one for quite a while
and it performed wonderfully. Even after being dropped out of a truck.
But it was asked about mods for the radio. But, as you said,..simply
put it is a performer.. And is simple to operate.

From: Aaron Ozminski <aozminski@NOSPAMdsw.com>
Subject: Is this the right place?

Very sorry if I'm addressing this question to the incorrect NG. It
looks like you are all heavy HAM operators/builders, etc., so this
request for help will be juvinile compared to the topics I've been
reading...

I simply want to 'jam' a commercial FM broadcast radio station (i.e.
over-ride 97.1Mhz). I only want to jam the signal for about a 100 foot
area. Short durations, not more that 10-15 minutes at a time.

(When I say jam, I really mean just making it unlistenable. I'm not
looking to broadcast a clear signal on top of it, but simply mess it
up.)

I've tried wireless FM microphones, but they aren't powerful enough to
broadcast on an existing station signal.

I've also built a 15 dollar FM radio microphone kit, but the kit
mentions that it works best on old dial type radios since it won't lock
on any one frequency very well. It didn't do the trick either.

This is, of course, for experemental reasons.
(Actually it's for a neighbor that insists on playing the radio, loud,
with lots of bass, at horrible times of the night. -They don't play CD's
too often- just the radio, and I just want to confuse them a bit ;)

Please email me with any info a budding electronics newbie could find
useful. (aozminski@dsw.com or remove nospam from the reply address.)

Thanks!!!

When I was in Germany (ten years as a DOD employee), I decided to buy
a Kenwood shortwave receiver from a local store (hey, the exchange rate
was good at the time). It had huge chunks of the shortwave bands
blocked out. The dealer had to send it to the Kenwood service center to
have the bands restored (as an American, I could purchase the receiver
with all the frequencies intact).

When the dealer got it back, he spent a couple of days listening to
what he was missing (with my permission - he had loaned me another
receiver). When he finally gave me the receiver, you could tell he was
envious (he handed me the receiver like he was giving up a baby).

When I bought a scanner, he absolutely had a fit. This time he ordered one from the factory with all the frequencies intact (for his American customer - as he was calling me by this time).

I thought I would never get that scanner from him (I felt like I actually had to pull it from his hands). Then he would not let me leave the store until he had listened some more to the "banned" frequencies. This time, he was like a little child - I actually expected him to start jumping up and down with joy.

I'm going back to Germany (the same town) in a few months (yes, I'm still with DOD). Wait until he has a look at some of the stuff I have now. He's going to want to live in my radio room.

> Oh yes, and single band 10M gear is totally banned from sale or
> import! Just in case it were to be converted for illegal use on 11M.
> As if there were not enough to go around anyway, if you were to
> know where to look.

Ask some of the American military personel stationed over there. They can order 10m radio equipment from the US. Of course, selling it to you (without paid customs duties, etc.) is absolutely illegal. And if single band 10M gear is still totally banned, I seriously doubt you would want to visit the local customs office to pay the duties on such a radio.

> Which I don't, of course, not that I would want to anyway. I was
> an illegal CBer a long time ago now (oops, that's blown my Amateur
> Credibility, if I ever had any!)

Oh, how could you? A Cber, and an "illegal CBer" at that. Your credibility has dropped to an all time low in my eyes. ;-)

> Dwight Stewart (KF4URZ)

Hi Dwight, glad you enjoyed the message and I can guess that your German friend enjoyed the radios!!!!

Yes, well, we all have skeletons! But if you own up to them no one can blackmail you for them ;-)

In fact, being an ex-CBer can be a help. Sometimes newcomers join the club or novice class and are appologetic about being a CBer. My response is 'Well so was I, it's radio isn't it?'

So what if others cringe and bluster, it's what you do 'now' that counts. How many do you know that were never 'CBers' but might as well be now? (and I'm talking almost every band and mode here!)

OK - so here goes, at one time or another I have been active on the following bands/modes (not an exhaustive list - everyone would get *really* bored) :-

10GHz, 24GHz, 73kHz (Homebrew, of course)
Built own packet TNC from a kit
QRP on 2M/6M and, sometimes, HF - Using homebrew gear
Worked Aurora on 2M using 3 Watts
Worked Es on 2M and 6M - Usually QRP (including currently holding an IARU distance record for 6M Es)

Not bad for a CBer? Oh yes, mostly CW op. as well!!

Funny Story = I was visited one day by another amateur, who I only knew a little, and he was looking at the simple 10GHz and 24GHz Wideband gear (very crude stuff!) and said "You'd never get one of those CB idiots doing this, would you?"

I said nothing, opened a draw and pulled out a 'You have been eyeballed by' badge. Funny, I never saw him again!

From: "Al Williams" <alw@al-williams.com>
Subject: MFJ AutoTuner Theory

Hello all.

I was noticing the other day that MFJ sells an auto-tuner extender designed to allow the internal autotuners on the new rigs to match odd antennas. Most of these internal jobbies only do 3:1 or less before they blow an underrated capacitor in the thing.

I don't own one of these, but it appears to be one knob and some coax connectors.

Now I got to thinking: what can this be doing. My first guess is it is a large torroid wound as a transformer with one side going to the antenna and the other going to the radio via the switch. The switch connects to any of several taps on the transformer secondary so you can transform various mismatches to a different range (Zp=Zs* N*N, right?). So with a 10:1 turns ratio, you'd bring a 300:1 match down to 3:1 (or a 1:10 ratio depending on the direction of the mismatch). With a 3:1 ratio, you'd could match 27:1.

Anyone have any thoughts on this? I've never seen any articles on this sort of thing. I don't even know if that is really how it works. What about the impedance of the coils? Can't null them with capacitors since there is only one knob. Maybe the XL is so high as to be unimportant compared to the reflected? How big a torroid would you need to handle the 300W this one does? What's the downside? Obviously there is some hysterisis loss in the core and resistive loss in the windings. Anyone have one of these? How does it work for you?

Well, sorry I got off on a jag. Just curious if I want to try to build one of these or pay Martin $40 and see how his works.

Will - Yes it's easy, provided you can keep resistive losses down by using a thick element. My own loop (for 80m) cost about $30 to build (I already had the large variable capacitor required).

All the info I needed was on the web. See the links section of my Novice Notes Online page (URL below) for all the information you'll need.

Any probe good for 60 MHz bandwidth will work. Tektronix OEM probes
seem to be the most reliable, but Probe Master and other brands are fine
too.

Hi All,

I have been trying to find an email address for someone from Amidon who could help me with torroids. The closest I've come is the ``comments and suggestions'' email facility on their website, to which I've sent three or four messages. However, it seems like they don't read these too often!

Could someone please let me know of someone I could email directly?

Many thanks,

Kevin Williams

...re: the suggestion to argue via email & not the NG's...

My vote -

Leave the arguement in. Don't take it to email.
I love reading Carl's opinions. He's like a
skin head or a bible fundamentalist preaching
on the street corner. Better than watching the
comedy channel. I can just picture the sweaty,
Jimmy Swaggart like, armpits as he composes
new messages. Perhaps, like the fallen Rev
Swaggart, we'll find Carl in the back room some
day, tapping out cw.

I'd like to hear just what it is that Carl wants
to do on the 'code restricted bands' that he
can't do now because of the big, bad impossible
code.

I'm pro code. I NEVER use code. I'm proud to say
I know code. A lot prouder than I am to say that
I knew the answers to some theory questions about
monostable flip flops. That one just doesn't seem
to attract the girls as much as Morse code.

372. Regen Rx Fun!

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-11 00:00:00 UTC
From: wmeara@erols.com
Message-ID: <34b8f61d.164352187@news.erols.com>
Source record: 87491

Just for kicks, I put together the little regen receiver that appears in Doug Demaw's QRP notebook. It consists of just one FET (which serves as LO, deterctor and front end!) and one 741 Op Amp AF stage.

I built it Ugly style on a piee of scrap PC board. I used a couple of junkbox ari variable caps for the maintune and bandspread controls.

The whole thing came together in about one day of casual building.

And it works! I can easily listen to the CW action on 80 meters. SSB too, but the rx lacks mechanical stability and its hard to keep it tuned to the "zero beat" point. I can also listen to the AM broadcast stations.

This was a fun project. I've built cat whisker and galena receivers, DC rigs and a superhet, but I'd somehow missed the regen stage. This receiver is NOT comfortable or easy to use - I now have a better appreciation for why Major Armsrong went on to develop the superhet.

I'm not going to spend too much more time on this project, but I think I will look for a better quality regen pot. The Radio Shack 10K pot that I'm using is not at all smooth or clean and I don't get an easy or smooth transition into oscillation.

Anyone else out there playing with regens?

Now do you honestly think that this guy or the general populous is gonna under stand this shit?
This is another example of nerds going overboard on a question...
Get to the point!!!
If he doesn't know what Desense is, he aint gonnna what all that extra shit your talking about is, Einstein.
Look, why can't we just adopt the KISS rule for the less knowledegable guys, Keep It Simple Stupid & more will benefit from the information shared!.
Your answers may be right, but you are going WAY overboard for a SIMPLE & COMMON problem.
When I (was a tech) went onsite to service commercial repeaters suffering from desense, I never had to go through that shit, you have to be out of your mind to think I was gonna sit their with my Svc.Monitor and measure half the levels you mentioned, I might as well build a new repeater form scratch!

I can't sit here & prescribe a remedy to fix your repeater, cuz i aint lookin at it, but you can start by making sure the simple things are verified OK, like:
TX/RX lines & connectors.
Is your Duplexor tuned properly? (use a tracking generator not the Mr. einstein method).
Do a 'general' check on the Recv'r, is it to spec?

Most of the time, desense could be eliminated by just making sure all your connections were solid & good & the radios were properly shielded...
Occasional tune ups on the Rcv'r were not uncommon, just not necessary to get so in-depth...
However if you wanna break out the Atomic ion Calculator, be my guest dude.

374. what do you think about this repeater?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-11 00:00:00 UTC
From: jhine41015@aol.com
Message-ID: <19980111131001.IAA09799@ladder02.news.aol.com>
Source record: 87493

I have the opportunity to purchase a split site repeater system which includes
the following...
GE MVP
Package consists of two separate units.
VHF Receive & Transmit units link via UHF.
VHF Tx 25+ watts - UHF Tx 20+ watts
VHF uplink & downlink transceivers
Crystal elements
Microphone & Speaker
Both units have PL tone boards
Full printed documentation of conversion

...well? Is this a good buy for $200?

thanks for your suggestions, comments, and opinions.

Hi All,

I have been trying to find an email address for someone from Amidon who
could help me with torroids. The closest I've come is the ``comments and
suggestions'' email facility on their website, to which I've sent three
or four messages. However, it seems like they don't read these too
often!

Could someone please let me know of someone I could email directly?

Many thanks,

Kevin Williams

construction and weather proofing of such a device and may be send me
a
>few of your ideas on this subject?

73, Chris....

I would try an idea I saw written up a long time ago. This is assuming you
want a split stator cap. The rotor is a U-shaped assembly of copper pipe and
90 degree elbows. The stator is two pieces of copper pipe covered with mylar
that can fit into the legs of the rotor piece. As the rotor slides further
onto or off of the stator pieces, the capacitance is varied. Motor drive is
simple... a threaded rod driven by a motor... either a stepper or a gearhead
lowspeed DC motor. I first saw this in conjunction with a compact loop also

made of copper pipe.

As for position feedback, the low-tech solution would be a piece of string hanging down from the rotor with a weighted pointer tied to the end, and a calibrated scale behind it. Otherwise, try a potentiometer with a pulley on the shaft, and a piece of string looped from and then back to the rotor in such a way that rotor movement turns the pot. a low DC voltage through a 1K or so resistor through the pot and returned to a cheap meter movement complete the setup. Open up the meter and cover up the calibration markings with blank paper onto which you make your own markings corresponding to position. You can calculate a better value for the 1K current limiting resistor and the position pot, and add a couple of pots for max scale and for zero adjust. This will give you a nice analog readout. If you will settle for low resolution digital, an array of LEDs and photodetectors seperated by a card with strategic holes punched in it can serve as a sensor, and you can get as low or as high as you like for a readout.

Personally I like the string and weight.

I wish I could remember where I saw the design for the loop and capacitor, because there was a source for the mylar and some notes on construction technique.

The capacitance can be calculated to within about 20% using the formulas if you know the dielectric constant of whatever material you use. Allowances must be made for the fact that you are not using flat plates which is why in the article the author noted that actual capacitance was somewhat different than what was calculated. Or, start with a rotor about 1 1/2" wide and about 8" long, build it, measure the capacitance, and cut till you got what you want.

Good luck. I wish I could tell you I have used this type capacitor in a loop antenna, but I haven't.

Subject: LISTEN A CELLULAR PHONE WHITH A RADIO

In article <19980110025430832 90@zetnet.co.uk>, David Ackrill <g0dja@zetnet.co.uk> writes:

>
> But you can't own a firearm, can you, English Slave?

> Bill

Why
>would I want to in a free country?

Dave

To keep it free, for one thing, and to keep the peace when violence or danger threatens, as it never seems to do with a cop around.

Freedom has nearly always though history came out of the barrel of a gun or at the point of a sword. Do you think King John signed the Magna Carta just cause he was a really nice guy deep down inside, and he was swayed merely by the humble requests of his beloved subjects? Do you think the American Revolution was actually just a series of cricket matches and the winner won? Maybe General/President Santa Ana of Mexico was so moved by our sincerity that he was compelled to surrender during the Texas War of Independence, voluntarily become a prisoner of war, and cede ove a half milion square miles of territory to the brand new Republic of Texas?

When only the government and criminals can have guns, and the people are defenseless, open to victimization by not so much their own government but also by vicious criminals that slip through the gears of justice to terrorize honest men and their families, something is dreadfully wrong. The biggest problem with laws that forbid the ownership of weapons is that since criminals by definition do not concern themselves with the legality of their actions, the laws only forbid the ownership of guns by those honest men who DO care about the law. This is a perversion and a travesty, and encourages perpetuation of such victimization.

"Where guns are outlawed, only outlaws will have guns"

The greatest deterrent to crime is not the miniscule chance of getting caught, going to trial, being found guilty, and having to go to prison. Far from it... The most powerful deterrent to crime is that a "victim" can shoot his assailant dead, dead, dead, so that he can never terrorize or brutalize again, and his raping, killing, theiving , mugging, pillaging days are over. His peers seem to get the message as well, oddly enough.

By the way, I apologize for my countryman about the "English Slave" remark. It had the ring of an insult to it and did not contribute much toward meaningful discussion.

Subject: MAKE MONEY!!! IT REALLY WORKS!!! IT DID FOR ME!!!

DO YOU WANT TO MAKE MONEY FAST?

Of course you do, we all do!

Here's how to do so with little effort, and, yes IT'S LEGAL. And for you doubters. I am laughing all the way to the bank :-) And guess what? I was a doubter too!!

A little while back, I was browsing these newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of $6.00! So I thought, "Yeah, right, this must be a scam!" but like most of us, I

was curious. Like most of us, I kept reading. Anyway, it said that if you send $1.00 to each of the 6 names and addresses stated in the article, you could make thousands in a very short period of time. You then place your own name and address at the bottom of the list at #6, and post the article to at least 200 newsgroups. (There are about 22,000.) or e-mail them to friends, or e-mailing lists...

No catch, that was it.

Even though the investment was a measly $6, I had three questions that needed to be answered before I could get involved in this sort of thing.

1. IS THIS REALLY LEGAL?

I called a lawyer first. The lawyer was a little skeptical that I would actually make any money but he said it WAS LEGAL if I wanted to try it. I told him it sounded a lot like a chain letter but the details of the system (SEE BELOW) actually made it a legitimate legal business.

2. Would the Post Office be ok with this...?

I called them: 1-800-725-2161 and they confirmed THIS IS ABSOLUTELY LEGAL! (See Title 18,h sections 1302 NS 1341 of Postal Lottery Laws). This clarifies the program of collecting names and addresses for a mailing list.

3. Is this moral?

Well, everyone who sends me a buck has a good chance of getting A LOT of money ... a much better chance than buying a lottery ticket!

So, having these questions answered, I invested EXACTLY $7.92 ... six $1.00 bills and six 32 cent postage stamps ... and boy am I glad I did! Within 7 days, I started getting money in the mail! I was shocked! I still figured it would end soon, and didn't give it another thought. But the money just continued coming in. In my first week, I made about $20.00 to $30.00 dollars. By the end of the second week I had a mad total of $1,000.00! In the third week I had over $10,000.00 and it was still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in.....

It's certainly worth $6.00 and 6 stamps!

So now I'm reposting this so I can make even more money! The *ONLY* thing stopping *ANYONE* from enriching their own bank account is pure laziness! It took me all of 5 MINUTES to print this out, follow the directions, and begin posting to newsgroups. It took me a mere 45 minutes to post to over 200 newsgroups. And for this GRAND TOTAL investment of $ 7.92 (US) and under ONE HOUR of my time, I have reaped an incredible amount of money -- like nothing I've ever even heard of anywhere before!

'Nuff said!

Let me tell you how this works, and most importantly, why it works. Also, make sure you print a copy of this article now, so you can get the

information off of it when you need it. The process is very simple and consists of THREE easy steps.

============
HOW IT WORKS
============

STEP 1:

Get 6 separate pieces of paper and write the following on each piece of paper:

PLEASE ADD ME TO YOUR MAILING LIST.
$1 US DOLLAR PROCESSING FEE IN ENCLOSED.

(THIS IS KEY AS THIS IS WHAT MAKES IT LEGAL SINCE YOU ARE PAYING FOR AND LATER OFFERING A SERVICE).

Now get 6 $1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope to prevent theft/robbery. Then, place one paper in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase and an U.S. $1.00 bill.

Mail the 6 envelopes to the following addresses:

#1 - D.Necalliski
1266 Lisa Drive
Warrington, PA 18976
#2 - Pete Sharpe
648 Midway Ave.
Holland, MI 49423

#3 - G. Rice
P.O. Box 572
Humboldt, AZ 86329

#4 - Kim Smith
700 Archer Street #1
McKeesport, Pa 15132

#5 - Peter L. S.
1253 Leaside drive
Pittsburgh, PA 15207

#6 - P. Sunshine
184 Plymouth Street
Pittsburgh, PA 15211

STEP 2: Now take the #1 name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc.) and add YOUR Name as number 6 on the list. (If you want to remain anonymous put a nickname, but the address MUST be correct. It, of course, MUST contain your country, state/district/area, zip code, etc! You wouldn't want your money to fly

away, wouldn't you?).

STEP 3: Now post your amended article to at least 200 newsgroups. Remember that 200 postings are just a guideline. The more you post, the more money you make!

Don't know HOW to post in the news groups? Well do exactly the following:

HOW TO POST TO NEWSGROUPS FAST WITH YOUR WEB BROWSER:

The fastest way to post a newsletter: Highlight and COPY (Ctrl-C) the text of this posted message and PASTE (Ctrl-V) it into a plain text editor (as Wordpad) and save it. After you have made the necessary changes that are stated above, simply COPY (Ctrl-C) and PASTE (Ctrl-V) the text into the message composition window, after selecting a newsgroup, and post it! (Or you can attach the file, without writing anything to the message window.)

If you have Netscape Navigator 3.0 do the following:

1. Click on any newsgroup like normal, then click on 'TO NEWS'. This will bring up a box to type a message in.

2. Leave the newsgroup box like it is, change the subject box to something flashy, something to catch the eye, as "$$$ NEED CASH $$$? READ HERE! $! $! $" Or "$$$! MAKE FAST CASH, YOU CAN'T LOSE! $$$". Or you can use my subject title.

3. Now click on 'ATTACHMENTS'. Then click on 'ATTACH FILE'. Find your file on your Hard Disk (the one you saved from the text editor). Once you find it, click on it and then click 'OPEN' and 'OK'. You should now see your file name in the attachments box.

4. Now click on 'SEND'/'POST'. You see? Now you just have 199 to go! (Don't worry, it's easy and quick once you get used to it.) NOTE: All the versions of Netscape Navigator's are similar to each other, so you'll have no problem to do this if you don't have Netscape Navigator 3.0.

! QUICK TIP!

(For Netscape Navigator 3.x and above)

You can post this message to many newsgroups at a time, by simply selecting a newsgroup near the top of the screen, hold down the SHIFT, and then select a newsgroup near the bottom of the screen. All of the newsgroups in/between will be selected. After that, you follow/do the basic steps, stated below at this letter, except of step #1. You can go to the page stated below in this letter and click on a newsgroup to open up the newsgroups window. Once you've done this, in the same window go to

'OPTIONS', and then mark 'SHOW ALL NEWSGROUPS' and 'SHOW ALL MESSAGES'. Now you can see all the newsgroups and you can apply easier the above tip.

If you have MS Internet Explorer do the following:

1. Go to the newsgroups and press 'POST AN ARTICLE'. To the new window type your headline in the subject area and then click in the large window below. There either PASTE your letter (which it's been copied from the text editor), or attach the file which contains it.

2. Then click on 'SEND' or 'OK'. NOTE: All versions of MS Internet Explorer are similar to each other, so you won't have any problem doing this.

GENERAL NOTES ON POSTING: A nice page where you'll find all the newsgroups if you want help is http://www.liszt.com/ (When you go to the home page, click on the link 'Newsgroup Directory'). But I don't think you'll have any problem posting because it's very easy once you've found the newsgroups. All these web browsers are similar. It doesn't matter which one you have. (But it makes it very easy if you have Netscape Navigator 3.0 or later. You may download it from the Internet if you don't have it.) You just have to remember the basic steps, stated below.

BASIC STEPS FOR POSTING:

1. Find a newsgroup and you click on it.

2. You click on 'POST AN/NEW ARTICLE' or 'TO NEWS' or anything else similar to these.

3. You type your flashy headline in the subject box.

4. Now, either you attach the file containing your amended letter, or you PASTE the letter. (You have to COPY it from the text editor, of course, from before.)

5. Finally, you click on 'SEND' or 'POST' or 'OK', whatever is there.

REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE! BUT YOU HAVE TO POST A MINIMUM OF 200

That's it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O.Box due to the large amount of mail you receive. If you wish to stay anonymous, you can invent a name to use, as long as the postman will deliver it.

**JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT. **

ANOTHER EXCELLENT PROGRAM: "AutoPoster" http://www.spck.se/bulk/

MULTIPLE. POSTING ON HUNDEREDS OF NEWSGROUPS AT ONCE . The worlds most effective AutoPoster to Internets newsgroups!

A high speed Newsgroup Auto Poster/Newsreader for Windows 95
Autopost articles to more than 27,000 newsgroups
Super fast - up to 12,000 posting per hour on a single PC
Easy to run

Built in Special Functions such as:
Scramble Random Fake Sender
Rotate Unlimited Postings
Group Postings
Force Hits

==========
Now the WHY part:
==========

Out of 200 postings; say I receive only 5 replies (a very low example). So then I made $5.00 with my name at #6 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #5 and only 5 persons respond to each of
the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #4 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3 and only receive 5 replies
each, I will make an additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they each only receive 5 replies, that just made me $3,125.00! Those 3,125 persons will all deliver this message to 200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups react I will receive $15,625,00! With an original investment of only $6.00! AMAZING! And as I said 5 responses is actually VERY LOW! Average are probable 20 to 30! So lets put those figures at just 15 responses per person. Here is
what you will make:

at #6 $15.00

at #5 $225.00

at #4 $3,375.00

at #3 $50,625.00

at #2 $759,375.00

at #1 $11,390,625.00

When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $6.00 to names on the list, putting your name at number 6 again. And start posting again. The thing to remember is, do you realize that thousands of people all over the world are joining the internet and reading these articles everyday, JUST LIKE YOU are now! So can you afford $6.00 and see if it really works? I think so... People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new

honest users and new honest people who are joining the internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual Internet. Remember, play FAIRLY and HONESTLY and this will work. You just have to be honest.

By the way, if you try to deceive people by posting the messages with your name in the list and not sending the money to the rest of the people already on the list, you will NOT get as much. Someone I talked to knew someone who did that and he only made about $150.00, and that's after seven or eight weeks! Then he sent the 6 $1.00 bills, people added him to their lists, and in 4-5 weeks he had over $10k. This is the fairest and most honest way I have ever seen to share the wealth of the world without costing anything but our time! You also may want to buy mailing and e-mail lists for future dollars. Make sure you print this article out RIGHT NOW, also. Try to keep a list of everyone that sends you money and always keep an eye on the newsgroups to make sure everyone is playing fairly. Remember that HONESTY IS THE BEST POLICY. You don't need to cheat the basic idea to make the money!

GOOD LUCK to all and please play fairly and reap the huge rewards from this, which is tons of extra CASH. Please remember to declare your extra income. Thanks once again...

==========

LEGAL? ? ? (Comments from Bob Novak who started this new version.)

"People have asked me if this is really legal. Well, it is! You are using the Internet to advertise you business. What is that business? You are assembling a mailing list of people who are interested in home based computer and online business and methods of generating income at home. Remember that people send you a small fee to be added to your mailing list. It is legal. What will you do with your list of thousands of names?

Compile all of them into a database and sell them as "Mailing Lists" on the internet in a similar manner, if you wish, and make more money. How do you think you get all the junk mail that you do? Credit card companies, mail order, Utilities, anyone you deal with through the mail can sell your name and address on a mailing list, unless you ask them not to, in addition to there regular business, So, why not do the same with the list you collect. You can find more info about "Mailing Lists" on the internet using any search engine.

." So, build your mailing list, keep good accounts, declare the income and pay your taxes. By doing this you prove your business intentions. Keep an eye on the newsgroups and when the cash has stopped coming (that means your name is no longer on the list), you just take the latest posting at the newsgroups, send another $6.00 to the names stated on the list, make your corrections (put your name at #6) and start posting again.

==========

NOTES:

*1. In some countries, the export of the country's exchange is illegal. But
you can get the license to do this from the post office, explaining the
above statements (that you have an online business,
etc. You may have to pay an extra tax, but that's OK, the amount of the
incoming money is HUGE! And as I said, a few countries have that
restriction.

*2. You may want to buy mailing and e-mail lists for future dollars. (Or

Hi Ted; I remember using something called "silver print paint". It came from
GC electronics. I think they are part of General Cement. It should be
available in most major electronic supply houses.

I've got a Circuit Works conductive pen, made by Planned Products,
303 Potrero Sreet, Suite 53, Santa Cruz, CA 95060.

You could try any decent auto shop. They generally sell small
quantities of conductive paint used to repair heating elements in car
windows.

Savant is one, another's called Virtuoso I believe. If memory serves, you also need to use the control panel device called SoftKISS. SoftKISS emulates a TNC in KISS mode. (It's been a few years since I was looking at this stuff, but I seem to recall that they said AppleTalk packets were similar to TNC packets and that's why a software emulator could be written).

For hardware, all you need is a packet modem. I saw somewhere a "poor man's packet modem" you could build that would work with SoftKISS and the packet terminal programs above.

I think I have all the software archived somewhere. If you can't find it, let me know and I'll e-mail them to you. They were all shareware.

It's many years since I played with them - I always used a cap. for
controlling the regeneration, with a "tickler" coil. A conductive
plastic pot. might be better. These are easily obtained here in the UK
(Maplin stocks them), and are quite cheap.

regen recievers sure are fun to build & operate. I've built a couple out of transistors but the best was using an '01a tube. there is nothing more pleasing than a hollow state rig. I also built a matching 1929 transmitter using the same tube & 10feet of 1/4 inch copper tubing wound around a spray paint can for the coil. Ten 9 volt batteries were series snapped to provide the plate voltage & I used a 6 volt lantern battery dropped down to 5volts through a resistor for the filament voltage. With less than 1 watt input I was able to work about 20 stations in about 6 states on 80 meters cw. I cant describe the fun i had.
For more info you can look in Dave Ingram's "Golden classics of yesteryear" & the reprint of "the 1934 shortwave radio manual".
Lindsay publications carries books on Bloopers(regen rx).
po box 538, Bradley, Il 60915-0538 tel#815-935-5353. They also have thier own web page & you can request thier "secrets" catalog.

Those radios make pretty good repeaters. The circuits of the
exciter and receiver boards are similar to the highly regarded
Mastr II series. The PA boards are a weak point, however.
I'd throttle them back to 15 watts or so for repeater use. (In
fact I did that when I was using MVPs for repeaters.) Better
is to discard the PA board and drive an externally mounted
Exec II or Mastr II PA unit. Then you can run about 60 watts
in repeater service.

Make sure that the preamp is installed in the main receiver,
or add a good one externally. I prefer the latter approach.

If the conversion is well done and well documented, this
setup is probably worth $200. But you can buy the radios
unconverted for about $25-$50 each.

Is the idea to use the 2N2222 in as many places as possible? You might try using the emitter- base of one in reverse as a zener diode. This was shown in the old days, when semiconductors were relatively new. Of course, if it doesn't zener at the voltage you need, then the idea is no good.

Years ago, 73 magazine had an insert "73 transistor circuits" which was a collection of various small circuits that had already been published. Later, someone wrote in and said that they were able to build most of the circuits with only two types of transistors, something like a 2N706 (which seemed to be used all over the place at the time) for the NPN's and something else for the PNP's. Certainly, that era is the place to look for transistor only circuits. I can't give any dates, but even in the '70's there would be transistor only IF strips shown. I look at those, and while they need more parts than IC's, they can usually be built with parts that you've saved off scrap circuit boards, making them cheap and even disposable.

Bill:

I have built several regen sets (mostly tube types), and they are somewhat difficult to keep under control. Types that use a throttle capacitor to control regeneration tend to be a bit quieter than those using pots. Hand capacity and other effects makes it difficult to stay on one frequency - if your antenna sways in the wind, the frequency is often changed, too!

I have some schematics for solid-state Doerle-type regen receivers that employ a throttle capacitor to control regeneration - it can easily be built in one day. I'd be happy to send one to you if you wish. E-mail me off-line if you are interested. Even with their quirks, regen sets are fun to build and play with!

> Frerking book.

The second book is technically out of print but I managed to obtain a
copy
from Amazon.com. The ISBN number is 0-07-912038-5

I can recomend both books, as I used them to design my SSB/ISB
receiver/exciter.
It was based on the Motorola EVM56002 card and a AD9850 DDS clocked at
the
full 125 Mhz using a Butler oscillator and a 5th overone xtal. I still
havn't
perfected digital AGC though! FWIW

There's a new program out called RDCP. It's in beta right now, but will
get you going. It's written for the Kantronics line of TNC's.

You can find it at:
http://www.winternet.com/~nedbalek/rdcp_mac.html

I have only built one regen, lifted from an old Popular Electronics magazine. I found the receiver performed much better with a pre-amp. I used one of the little MMIC DC-to-daylight jobs without a tuned circuit which would have made yet more improvement and kept the parts count down that way. Not only did it improve reception somewhat, but it also stopped the receiver from radiating. Without the amp, the "signal" from my radio was very strong close-in, and I bet it was clearly audible at several miles. I also used an old pre-selector module I had laying around which seemed to help a bit at times, but attenuate weak signals at other times. My receiver tuned from about 9400 to a bit over 9800 KHz, aimed at the low end of the band for the 9410 BBC broadcast..

Regens are indeed a pain in the butt. It helps to use a metal case and insulated extensions for the front panel controls, along with good grounding. Open breadboard regens suffer badly from de=tuning due to "hand capacitance".

It is fun to build regens and see just how much we have came from such crude technology, but as for operating them, many find the novelty wears off rather quickly.

A steady hand on the REGEN control is a must for listening to anything but the strongest signal. I guess a circuit could be designed to automatically maintain regeneration to just under the point of oscillation, or just over it for CW or SSB, but with the added complexity you could easily build a superhet or a very nice DC set.

good luck with the project. Why not post your results? We all post asking for help, but not enough of us post with the results of our experiments and projects.

mud (mud@rtrower.com) wrote:

: Funny this should come up now. Just yesterday I was working
: on trying to restore one of our remotes.

: To my surprise, cleaning the pads and pcb did not help!

: I got out the trusty Fluke, and found that most of the
: rubber pads on the membrane measured about 50K, but some
: were up in the megohms.

: That really surprised me, since I'd assumed they were
: homogenous, i.e. the same material all through.

The BETTER ones are indeed conductive through-and-through, but the cheaper ones just use a coating-on those cleaning them can sometimes make things WORSE.
There are products on the market to recoat those pads, but they often don't stick well-and the ones that do tend to be..
1.costly
2.come in 2 parts that have to be mixed just before use.
3.can't be mixed in a small quanitity-you need to mix the whole kit, and unless you have 10 or more remote controls, you end up wasting much of it.

Other ideas?
1. plain old India ink will work, and it should be inexpensive...just put several coats on the pad(let each coat dry before applying the next, of course).
2.Adhesive metal foil should work.
some examples of #2 are: get a roll of metalized Mylar cue tape(used on motion picture film to activate projector change-over, shut down, etc). This is similar to the stuff that used to be used on 8-track tapes to change tracks.
Another idea is to get a roll of alarm foil(used on windows to detect a glass break)-this is not as durable as the cue tape, but it should work ok.
Also, 3M, and prehaps other companies sell metal tape which should be quite suitable, but costly.

: Apparently, the conductivity was only a -surface- effect,
: i.e. a coating or something.

: I have one of those silver conductive paint pens, but the
: material would not stick to the rubber dots. sigh....

: Haven't worked on it since then, but my next experiment will
: be to test a non-used key to find what glue -will- stick to

: it, and then to glue thin copper foil dots to each pad.

You could also get more conductive rubber-either from a supply source(I have no idea where), or by cutting the "dots" off of a scrap remote-odd ones can often be found for $0.25 to $1.00 if you look around.

Some elastomer keypads can be brought back to life by first cleaning as
was suggested below and THEN coating the keypad tip with marks from a very
soft pencil lead. The graphite will stick where other materials will not.

Source record: 87513

I have been using an OHR100, the version before the 100A, and it works very well. I have the 20 meter version. The only thing I did to mine was to change the main tune pot to a multi-turn (10 turn) pot from the existing 1 turn pot. This made tuning much smoother. The performance of this little rig is excellent. You can't go wrong with this little kit. Best 73, AL, VE6BPR...sk

under stand this shit?
This is another example of nerds going overboard on a question...
Get to the point!!!
If he doesn't know what Desense is, he aint gonnna what all that extra
shit your talking about is, Einstein.
Look, why can't we just adopt the KISS rule for the less knowledegable
guys, Keep It Simple Stupid & more will benefit from the information
shared!.
Your answers may be right, but you are going WAY overboard for a SIMPLE
&
COMMON problem.
When I (was a tech) went onsite to service commercial repeaters
suffering
from desense, I never had to go through that shit, you have to be out
of
your mind to think I was gonna sit their with my Svc.Monitor and
measure
half the levels you mentioned, I might as well build a new repeater
form
scratch!
>
I can't sit here & prescribe a remedy to fix your repeater, cuz i aint
lookin at it, but you can start by making sure the simple things are
verified OK, like:
TX/RX lines & connectors.
Is your Duplexor tuned properly? (use a tracking generator not the Mr.
einstein method).
Do a 'general' check on the Recv'r, is it to spec?

Most of the time, desense could be eliminated by just making sure all
your
connections were solid & good & the radios were properly shielded...
Occasional tune ups on the Rcv'r were not uncommon, just not necessary
to
get so in-depth...
However if you wanna break out the Atomic ion Calculator, be my guest
dude.

STUFF SNIPPED

I gotta tell you, "DUDE", that I very much appreciated Paul's response.
I wish others had added their in-depth knowledge of the subject.

Yes, I did understand what he was saying.
Yes, I am building a new repeater from scratch; including the duplexer.
Yes, I do have double-shielded cables everywhere.
Yes, I do use a tracking generator to tweak the cavities.
If you have the commercial version of an Atomic ion Calculator, it's probably my design.

Don't assume that other people are dummies. There are no dumb questions,
just...well, you know.

Sit back, take a deep breath...and a midol...and quit abusing knowledgeable people for being helpful.

Thanks again, Paul.

I've seen the letters that came in about the regen rx. I recently found a schematic of one in the 96 edition of the ARRL Handbook. I was wondering if anyone has built this one? I have thought about it, but I can't seem to find some of the parts. It seems like it would be a nice radio to build. I guess the toughest parts to find are the air variable caps. Anybody got any suggestions on where I could order some?

Also, I recently salvaged the parts from an old tube reciever that had a recieve range of 100-2000 KHz. It contained an air variable cap, but it wasn't labeled. The only thing it said was "RCA." Anybody got any ideas of what the mfd value might be?

Source record: 87429

In order to put the 148 on 10 meters you have to change the 11.325 loop oscillator crystall to force the VCO up to 36 mhz. For 28.305 to 28.745 mhz, in 10 khz steps of course, you would need a 11.77166 mhz loop crystal. It's figured this way for channel 1 ....

28.305 mhz plus first mixer frequency of 7.800 mhz = 36.105 mhz. Which represents the required VCO frequency.
36.105 minus the channel 1 down mix frequency 0.790 = 35.315.
Since 35.315 is the result of the loop crystal tripled, divide by 3.
35.105 divided by 3 = 11.77167 mhz.

> I am looking for anyone who has built the 432 Mhz transverter
> and could offer their comments good/bad/easy to build ????

I've not built it, but I have looked very carefully at this section of Ian's book, while trawling for ideas for developing a high dynamic range front-end for use in repeaters located on troublesome sites. It looks well worth building if you are interested. There are signs that the design was done pretty thoroughly, and I would expect it to be quite dependable. There are also the no-tune designs from the USA, look for Zack Lau's stuff in ARRL publications and kits from Down East Microwave for other designs.

> Also if possible if someone is willing to photocopy the article for me
> or scan it and email them to me in any popular graphic format.
> It would be greatly appreciated.

It's a very good book. If you intend building something of this extent, the accompanying reference material by the same group of people might prove to be helpful. I don't know about book availability from VK stockists, but this one is worth waiting for by snail-mail. Besides, Ian reads this group and is a pretty decent fellow ($5). I think he'd be reasonable about photocopying if there was no alternative, but with a current book and many outlets (compatible with any popular credit card format) this is not really the case, so if I offered to photocopy the thing, I might find terrible things about me being revealed in a column in Radcom......

If the book really is difficult to obtain, then I may be able to help get one to you.

Cheers
David GM4ZNX

Jody: don't get too hung up on getting the precise values for the caps. I used junkbok models. There are a lot of variable caps around with a value of 365 pf. If you need one with a lower value, you can pluck out some of the blades! My bandspread cap is a 35 pf variable out of a junker Swan 240. Since you'r probably not going to be using the regen for anything beyond some fun experimentation, its probably not worth it to order some new (expensive) air variables.

Message-ID: <34ba4296.249464077@news.erols.com>
Source record: 87432

My fellow regenerators:

Thanks to all for the info on the regens. Some observations on mine:

-- I threw the chassis/cabinet together very quickly. More
attention to stability would have been a good idea. The suggestion
for standoff tuning controls for the caps is excellent.

-- I tried to use an additional AF amplifier stage to drive a
speaker, but because the speaker was mounted on the same panel as the
tuning caps, I was getting some wicked feedback. I think the
feedback mechanism was mechanical, not electrical! I think the
vibrations from the speaker were jiggling the caps and the wires to
the caps at an audio rate! This set up a feedback loop and the thing
started to howl. I could kick off the howling by giving the cabinet
a little filliip with my finger! So I dropped the additional AF Amp
and went back to headphones. No more howling.

-- My RX is quite sensitive when the deterctor is in oscillation,
but it is NOT sensitive when it is out of oscillation. In this
condition, only the strongest SW BC statios come through, and tuning
is "broad as a barn door". I tried putting a broadband RF amp ahead
of the detector, but I live in the midst of the powerful AM broadcast
stations of Arlington Va. and the additional amp caused these
stations to show up in the rx output.

Three cheers for Major Armstrong!

This is a real needle in the haystack search, but I am looking for the 160
meter coil strip for a Meissner Model EX Signal Shifter. It's Meissner model
#18-3575 and is usually in the "F" position of the bandswitch. Thanks.

>I wish I could remember where I saw the design for the loop >and capacitor, because there was a source for the mylar and >some notes on construction technique.

On article along these lines is ' A Homebrew Loop Tuning Capacitor', Bill Jones, QST, Nov 1994, pp.30-32, with construction details of a 100W loop and U-shaped capacitor.

For a list of loop references, visit GW0TQM's mag loop page at http://ourworld.compuserve.com/homepages/csl/magloop.htm

Subject: Improve DC transceivers for 80/40m (Weaver type)

Matjaz Vidmar S53MV describes Zero IF Weaver type transceivers for microwave bands in DUBUS info nr 3+4/97 and Weinheim VHF meeting 1997. Denys Roussel F6IWF describes phase type DC transceiver for 40m at Weinheim meeting (compendium) 1994 and 1995. F6IWF discuss the IM problems and explain why normal LC-filters are not selective enough for 40m to avoid overload from strong BC stns outside the ham band (7000-7100kHz).
IM problems is the reason for S53MV only made transceivers for 23, 13, 6, 3cm bands where one normally have few signals simultaneously.
F6IWF uses a Murata SFE 7.02 MC ceramic filter to improve selectivity, and with this one will have satisfactory sensitivity up to 7130kHz and above 7150 attenuation becomes more important and broadcast signals are attenuated significiantly. His project is realized for DEM100.-($60.-). Sideband suppression for RX is 46dB and for TX is 35dB.
With the Weaver type better sideband and carrier suppression is achieved.
It seems fairly easy to build equipment for any band, but dynamic range for RX is critical, it is simply not possible to use RF gain to reduce signal level, some 40dB minimum dynamic range is considered important for the audio stages in rural areas.
Whether a construction is possible or not depends on available ceramic filters to improve front-end selectivity. So far I only know the available ceramic resonators for 3.58 and 7.02MHz. The 3.58MHz resonator is easily tuned 3.498-3.630kHz, so it might cover 80m cw band, but LC-filter may seem adequate(?)

Aaron, your "broadcasting" might not be illegal. At micro-power levels, transmittling on almost any frequency is aok by the FCC. Generally, I believe this power level is 100 mw effective radiated power. One caveat though is that generally if you cause interference with an unlicensed device to another legitimate LICENSED service, you are at fault. So, I urge you to use only the power necessary to do what you gotta do. Also, if anybody asks, stress the EXPERIMENTAL aspect rather than the utilitarian one of your project.

A R/O I sailed with a while back rebroadcast the AFRTS subcarrier from the 1691 MHz or whatever it is signal from the INMARSAT satellite all over the ship. The deviation characteristics of the signal were those of the normal narrow band AFRTS FM downlink, and so there was a lot of noise in the signal when received by an FM broadcast receiver. Nevertheless, those either not SWL inclined, or those who liked the AFRTS programming (Yiccchhhh!) listened to it.

The "Transmitter" was a television pre-amp such as you buy at walmart for a few bucks. He just turned it around backwards, I guess you would say, and fed it to an old VHF log-periodic TV antenna. The signal was audible anywhere topside.

Try the pre-amp trick. Use a 3 or 4 foot piece of wire for a transmit antenna, and cut the wire back until the signal is too weak; then increase the length again until it is just satisfactory. Then visit the neighbors and make sure your signal does not interfere with ANYTHING. Ideally, they should not notice any signal at all on their sets when tuned to your VCR frequency, probably VHF channel 2 or 3.

There are commercially available setups designed just for what you want to do, with various price ranges, but do it yourself and you will save a few bucks and learn something about RF.

Note... If your signal is copiable on TV sets outside your house, not only do you risk being in violation, and getting the neighbors very very mad at you, but you might also incur the wrath of the MPLA. This is not a revolutionary army, though the acronym does sound rather menacing; it stands for Motion Picture Licensing Association. Your storebought or rented videos are for private, home use only, and you will be broadcasting them without a license agreement with the MPLA, which collects licensing fees and royalties for virtually every video producer. They will be more likely to ream you than the FCC.

So with all these warnings and hints, have fun, but do be careful.

http://www.osha.igs.net/~durhamradio/tv6.htm sounds like a good,
educational way to accomplish what you're after. I don't think you need
to worry about jack-booted FCC thugs breaking down your door at 4 AM
:-), but please be considerate of your neighbors when experimenting with
this stuff. The key to efficient communications is using no more power
than necessary, something that's lost on a lot of "legal" ham operators.

if your FM transceiver does'nt have clean cw tone, it is not worth
thinking about further modifications, and I I would not believe it is,
several xtal controlled FM transceivers have bad carrier signal tone
even as unmodulated.

Jacques,

A pad is a pad (no hole). Looks like you want to select a 'via'
using EasyTrax. As I recall, easyTrax will allow you to size
the OD and ID of the hole for the via.

Of course if you have some other reason for a hole in a pad
(such as a really big pad with a really small hole) you could
assign a hole to be drilled in the center of your pad.

Good luck,

Shawn WB6JWB

Subject: FS 6 meter low pass filter

It is better to install a Low Pass Filter before you meet
and talk with neighbors about your ham radio.
Designed / Built By JR KB5MER
6 Meter Low Pass Filter Models:
Model#1 Harmonic down 38 dB @ 75 MHZ
52 dB @ 100 MHz
58 dB @ 120 MHz
Handles up to 250 watts PEP $39.00
Model #2 Harmonic down 68 dB through 900 MHz.
Handles up to 2 KW PEP $60.00
* Insertion loss less than one (1) dB
*All part as built to with stand a 4 to 1 SWR
*All test were made into 50 ohm load
* Test made by Austin Radio Lab
Price plus $5.00 shipping & handling Con US.

> Roy Lewallen, W7EL

One IC variation Paul might consider is Philips' 74HCT9046A, which has several improvements over the '4046 (bandgap voltage reference for the VCO & no dead band in the charge pump phase comparator, IIRC). However, the '9046 isn't quite pin-for-pin compatible w/ the '4046, so Paul should consider obtaining a data sheet on the '9046...it should be available at Philips Semiconductor's web site (http://www.semiconductors.philips.com/ if memory serves).

Even with the improvements in the '9046, it's possible it won't be suitable for Paul's intended application, but like Roy, I'd encourage Paul to give it a try.

Just my $0.02.

Never said that it was not a great rig. I had one for quite a while and it performed wonderfully. Even after being dropped out of a truck.

But it was asked about mods for the radio. But, as you said,..simply put it is a performer.. And is simple to operate.

Subject: Is this the right place?

Very sorry if I'm addressing this question to the incorrect NG. It looks like you are all heavy HAM operators/builders, etc., so this request for help will be juvinile compared to the topics I've been reading...

I simply want to 'jam' a commercial FM broadcast radio station (i.e. over-ride 97.1Mhz). I only want to jam the signal for about a 100 foot area. Short durations, not more that 10-15 minutes at a time.

(When I say jam, I really mean just making it unlistenable. I'm not looking to broadcast a clear signal on top of it, but simply mess it up.)

I've tried wireless FM microphones, but they aren't powerful enough to broadcast on an existing station signal.

I've also built a 15 dollar FM radio microphone kit, but the kit mentions that it works best on old dial type radios since it won't lock on any one frequency very well. It didn't do the trick either.

This is, of course, for experemental reasons.
(Actually it's for a neighbor that insists on playing the radio, loud, with lots of bass, at horrible times of the night. -They don't play CD's too often- just the radio, and I just want to confuse them a bit ;)

Please email me with any info a budding electronics newbie could find useful. (aozminski@dsw.com or remove nospam from the reply address.)

Thanks!!!

Aaron Ozminski

When I was in Germany (ten years as a DOD employee), I decided to buy a Kenwood shortwave receiver from a local store (hey, the exchange rate was good at the time). It had huge chunks of the shortwave bands blocked out. The dealer had to send it to the Kenwood service center to have the bands restored (as an American, I could purchase the receiver with all the frequencies intact).

When the dealer got it back, he spent a couple of days listening to what he was missing (with my permission - he had loaned me another receiver). When he finally gave me the receiver, you could tell he was envious (he handed me the receiver like he was giving up a baby).

When I bought a scanner, he absolutely had a fit. This time he ordered one from the factory with all the frequencies intact (for his American customer - as he was calling me by this time).

I thought I would never get that scanner from him (I felt like I actually had to pull it from his hands). Then he would not let me leave the store until he had listened some more to the "banned" frequencies. This time, he was like a little child - I actually expected him to start jumping up and down with joy.

I'm going back to Germany (the same town) in a few months (yes, I'm still with DOD). Wait until he has a look at some of the stuff I have now. He's going to want to live in my radio room.

> As if there were not enough to go around anyway, if you were to
> know where to look.

Ask some of the American military personel stationed over there. They
can order 10m radio equipment from the US. Of course, selling it to you
(without paid customs duties, etc.) is absolutely illegal. And if
single band 10M gear is still totally banned, I seriously doubt you
would want to visit the local customs office to pay the duties on such a
radio.

> Which I don't, of course, not that I would want to anyway. I was

> Dwight Stewart (KF4URZ)

Hi Dwight, glad you enjoyed the message and I can guess that your
German friend enjoyed the radios!!!!

Yes, well, we all have skeletons! But if you own up to them no one
can blackmail you for them ;-)

In fact, being an ex-CBer can be a help. Sometimes newcomers join
the club or novice class and are appologetic about being a CBer. My
response is 'Well so was I, it's radio isn't it?'

So what if others cringe and bluster, it's what you do 'now' that
counts. How many do you know that were never 'CBers' but might as
well be now? (and I'm talking almost every band and mode here!)

OK - so here goes, at one time or another I have been active on the
following bands/modes (not an exhaustive list - everyone would get
really bored) :-

10GHz, 24GHz, 73kHz (Homebrew, of course)
Built own packet TNC from a kit
QRP on 2M/6M and, sometimes, HF - Using homebrew gear
Worked Aurora on 2M using 3 Watts
Worked Es on 2M and 6M - Usually QRP (including currently holding an
IARU distance record for 6M Es)

Not bad for a CBer? Oh yes, mostly CW op. as well!!

Funny Story = I was visited one day by another amateur, who I only knew a little, and he was looking at the simple 10GHz and 24GHz Wideband gear (very crude stuff!) and said "You'd never get one of those CB idiots doing this, would you?"

I said nothing, opened a draw and pulled out a 'You have been eyeballed by' badge. Funny, I never saw him again!

From: "Al Williams" <alw@al-williams.com>
Subject: MFJ AutoTuner Theory

Hello all.

I was noticing the other day that MFJ sells an auto-tuner extender designed to allow the internal autotuners on the new rigs to match odd antennas. Most of these internal jobbies only do 3:1 or less before they blow an underrated capacitor in the thing.

I don't own one of these, but it appears to be one knob and some coax connectors.

Now I got to thinking: what can this be doing. My first guess is it is a large torroid wound as a transformer with one side going to the antenna and the other going to the radio via the switch. The switch connects to any of several taps on the transformer secondary so you can transform various mismatches to a different range (Zp=Zs* N*N, right?). So with a 10:1 turns ratio, you'd bring a 300:1 match down to 3:1 (or a 1:10 ratio depending on the direction of the mismatch). With a 3:1 ratio, you'd could match 27:1.

Anyone have any thoughts on this? I've never seen any articles on this sort of thing. I don't even know if that is really how it works. What about the impedance of the coils? Can't null them with capacitors since there is only one knob. Maybe the XL is so high as to be unimportant compared to the reflected? How big a torroid would you need to handle the 300W this one does? What's the downside? Obviously there is some hysterisis loss in the core and resistive loss in the windings. Anyone have one of these? How does it work for you?

Well, sorry I got off on a jag. Just curious if I want to try to build one of these or pay Martin $40 and see how his works.

Will - Yes it's easy, provided you can keep resistive losses down by
using a thick element. My own loop (for 80m) cost about $30 to build (I
already had the large variable capacitor required).

All the info I needed was on the web. See the links section of my Novice
Notes Online page (URL below) for all the information you'll need.

of what the mfd value might be?

Just use it. See if it works in your application. if it doesn't, add about 100 pf in parallel. If it is too touchy, add about 300 in series.

When I'm just messing around I don't worry about air variable values too much... You can always pad and trim, or try another junk capacitor.

If you really NEED to know, buy or build a capacitance meter, a DVM that also measures capacitance, or an adapter for your existing meter. You can also try resonating the cap with a ciol of knowm inductance and see what the freq is, then calculate the capacitance from the formulas in the ARRL Handbook or other reference.

You didn't metnion whether the capacitor was from the VFO or not... I am assuming it is. It could be round 300 pf..or more... or less... just try it out.

Cross-posted to: rec.radio.amateur.homebrew,rec.radio.swap

I have three 5V 200A power supplies (amazingly small, about 12" deep x 5" wide x 8" high, though very solid and heavy). They weigh approx. 15 pounds each.

They are JETA Power Systems, Inc. Model G1001-1
Input Options: 3 phase 208v 3.5a 47-400hz, OR 230v 9.6a 47-60hz
Output: 5v 200a. Each unit has its own built in fan, massive plated connection posts, etc.

Adjust the output of each up a little and have a 12v 200 amp supply (with both tied together in series).

I am keeping one and need to sell the other two. Asking $50. each or $85 for both, plus actual shipping cost to you.

FB on your Regen, Bill. Glad you got it working, and thanks for your observations regarding the speaker. The effect you noticed is often referred to as microphonics. Somewhere in the circuit wires, capacitor plates or other conductive parts were vibrating to the audio frequency, and the movement changed stray capacitance and inductance values, in effect modulating those values at the audio frequencies.

One cure would be to mount the speaker alone in a seperate enclosure. You could TRY switching from a non-inverting amp to an inverting one or vice versa but that's not a garuanteed fix.

A passive high-pass filter with about a 2500 KHz cutoff along with good shielding will help keep the broadcast stations from overloading your receiver. You might even try an old antenna tuner.

Thanks for posting your results... all too often somebody plans a project with community input from the ng, and when they have all the info needed, the builder disappears and we never know whether the dern thing worked in the end or not.

Vade-Mecum 1958 shows only
ECH4 (EUR) and ECH4G (Philips), the first is triode-hexode while the latter is hexode only. Perhaps the Philips one is directly heated, the diagram may be wrong. Connections are much different and they can not be interchanged (example: ECH35 and 6K8, one is dual and the other single system, but either will normally work in the same socket).

Hi all. After Steve Webber published his 2N2222 effort in the lastest QRPp issue I wondered just how many 2N2222 units could be paralleled to increase the power output. In rapid fashion I found that both the power output and the capacitances increased linearly which is not surprising, but six units in parallel was enough for ten watts input on 40 meters. The secret seems to be sure that all transistors are thermally connected together and if you have the time, try and beta match these as well!

422. Question: Design of homebrew Variable Capacitor

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-12 00:00:00 UTC
From: NOSPAMpfriedr@azstarnet.com
Message-ID: <NOSPAMpfriedr.78.00894FE7@azstarnet.com>
Source record: 87448

I am tinkering around with some scrap sheet brass and a soldering iron, in an effort to homebrew a variable capacitor. Basically, we are talking about the familiar nautilus-shaped rotor that rotates 180 degrees into a rectangular bank of fixed plates.

I understand the basic formula for capacitance (given area of plates, spacing, and dielectric constant). I also know the formula for resonance if the capacitor was coupled to a simple inductor (one over two-pi times root of product of l&c).

My question relates specifically to the shape of the rotor. It would seem to me that if a capacitor with a simple semi-circular rotor were fitted with a little paper dial, as you turned it to one extreme, the stations recieved on a radio based on this capacitor would begin to "crowd" together. This I would attribute to the non-linear relationship of frequency to capacitance. If you wanted to "linearize" the dial, that is, spread the stations out evenly, you would have to modify the curve of the rotor to compensate for that --- am I correct?

I wrote a little program to compute rotor radius vs angle theta curves for a rotor with a linear frequency distribution across its sweep, and ended up with a rotor very UN-like anything in my junk box. Its still nautilus-shaped, but more flat than round. Perhaps there is an error in my calculations. Speaking of the junk-box, I can actually identify *several* distinct rotor curves.

Could somebody elaborate on the purpose of these varied shapes? If I wanted to design a rotory variable cap, say, for a crystal radio, is there a polar expression (r=f(theta)) that would describe the rotor plate shape? A normalized shape expression is fine, because I can then scale it (size and number of plates) to any capacitance range I need.

Perhaps there is a website that has this information?

Please reply directly via email: pfriedr@azstarnet.com.
Thanks in advance to all who reply.

1998 JAN 12 20:05 PST

Missile Launch Status/Communications Plan

Last week I called a public affairs officer at the Strategic Defense agency near Washington, D.C. and was told that this month's launch of a modified Minuteman II from Vandenberg AFB was scheduled for Friday, the 16th. This information appears to be wrong.

I called the Public Affairs Office at Vandenberg AFB this morning and was told that the launch is still set for this Thursday, January 15th at 17:39 PST (the launch window runs from 17:39-20:39 PST).

If the launch occurs on time, it should be visible as far away as central Arizona, central Nevada, southwestern Utah, most of California, and northern Mexico.

Here's a plan for passing along the countdown status:

1. Start the Vandenberg Launch Net at 17:00 PST on the 147.000 MHz Santa Barbara repeater (PL 131.8 Hz, -600 KHz offset). There's a good chance that I'll be on-base and able to pass the countdown status over this net. As a backup, a few hams will be given a special telephone number on the base where they can get this information and subsequently share on the repeater.

2. Start a parallel Vandenberg Launch Net at 17:00 PST on 3,815.5 KHz LSB.

3. Have the hams who can hear the Santa Barbara repeater, and who have 80 meter capability, pass what they hear on the VHF net over to the HF net. For those of you in oulying areas, you can try calling Dan, AC6NZ in Oxnard, California on 80-meters for launch info.

4. Have the hams in Arizona, Nevada, and southwest Utah pass what they hear on the HF net over their local 2-meter repeaters. As a backup, a few hams in these areas will be given the special telephone number at Vandenberg in case the 80 meter net breaks down.

To help pull this thing off, I need the following:

1. The telephone number of at least one ham who lives very close to Vandenberg AFB and who has 2- and 80-meter capability.

2. The telephone number of one ham in Arizona, Nevada, and southwestern Utah who has 80-meter capability.

Please feel free to retransmit this message via packet radio and other means.

As the launch date approaches, refer to my web page for updates (the address is given above). Also, call the Vandenberg Launch Update Line at 805-734-8232 extension 61857. Be advised, however, that this number isn't updated from T-1 hour to T+1 hour (the Public Affairs Office staff is busy supporting the news media and answering phones).

I brought mine back to life by cleaning with acetone, then painting
each pad with rear window defroster repair paint obtained from my
local NAPA store. The paint comes in a small bottle and appears to be
loaded with copper. I allowed the paint to dry overnight before
reassembling. Occasionally a small piece of paint will flake off and
cause the control to turn on. Usually I can just tap it on edge and
it'll stop. Worst case I open it up and blow it out. I find that the
controls work better than new.

>Any ideas as how to build a HF QRP tranceiver using
>upto 22 2n2222 transistors and NO ICs.

Greetings P. Singh,

Yes, I have been working on a 4X2N2222 RF power amplifier design. It's basically two pairs of parallel 2N2222A's in a push-pull amplifier circuit. Broadband transformer input and output with a feedback loop should resolve any instablilty problems. The only concern is the halved input and output impedance of each pair. I think it will work though with careful transformer design.

Another idea about the "2N2222 ONLY" contest....

1. You can cascaede IF amplifier stages for increased gain. I would think 3 stages shoulf give sufficient gain for 60 or 70db of agc range. Put the high-selectivity IF filters before the IF amplifiers with perhaps a broader filter at the output will help with the noise figure.

2. Use 1N914 diodes for the product detector and perhaps the mixer for a superhet. They may be noisey on the higher frequencies so perhaps a quieter diode or stick with 160 through 20 meters. 1N914's are like 2N2222's... they are easy to find and very cheap.

3. Another Colpitts oscillator 2N2222A for the BFO followed by a buffer amplifier 2N2222A should give sufficient level of BFO for injection to the diode product detector.

4. Audio amplifiers are easy with the 2N2222a. A pair of 2N2222A's in push-pull should give more than sufficient drive for "walkman" type headphones.

5. A good VFO circuit for the 2N2222a is the Colpitts oscillator followed by a buffer and an amplifier. All three may be 2N2222a's (followed perhaps by the push-pull/parallel power amplifier mentioned above for 1 watt or more output to the antenna?)

Anyway, It is a great little contest sponsored by the NORCAL QRP club. Just find their web page for details of the contest.

73's and regards to all...Frank

Hello all,

I am currently building (experimenting) with one of these Phillips PLL chips, with an aim of making a 70cm PLL module for FSK data. Has anyone out there had any experience with them? I have it mounted on a board with a 10 MHz oscillator and mini-circuits VCO, and have written a C program running under linux to program it, but so far, no luck. A few too many unknowns maybe... I have seen similar projects done using motorola PLL chips but I was not able to source any of these in Australia (well, not at least in small quantities).

I hope I haven't zapped it, as it is a surface mount part and has had a bit of handling. Are these very tough when it comes to handling etc?

please explain!

I am aware of that E=6.3V indirectly heated valves
C = triode, H = Heptode/hexode
I am not certain that this applies directly for ECH3G and ECH4G
I have the Philips: Daten und Schaltungen moderner empf�nger und Kraftverst�rkerr�hren dated 1940 and 1942. Several pages of data for ECH3 are shown, so I am not certain why the letter G (and A) are sometimes used.

I am trying to build a power amplifier for 50 MHz using a QQE06/40.
It seems hard to find any schematics for this valve, but in "Tecnical topics notebook" I found one.
But I canï¿½t get it to work. The rf to the valve is fed via a toroid transformer without any tuning capacitor.
The text say that it is tricky to get it working. For me, it is impossible.

Can anyone give me the appropriate values for a more "normal" feeding using airwound coils and varable capacitors?

Tnx in advance.

It may be illegal in the US of A but not everywhere......here in the Great White North it is legal to listen to any wireless signal be it celluar phone, baby monitors, cordless phones, gov't stuff or anything else as long as you don't repeat it or use it to your own benefit... ie...stock market etc.....Whats the difference between listening to your neighbour on a cell phone or listening to the police making a report about your neighbour (which, I believe, is legal in the U.S.A.). If you are using a wireless transmitter, you should have the common sence not to devulge any personal information over any wireless transmition anyways....

Allocations of frequencies aren't private by anymeans and if you have the receivers to receive or the software to decode then you should have the right to listen.....it may not be moral but it shouldn't be prohibited.

There are mods on the internet for just about any amateur radio to receive cellular as well as non-distructive mods (non-permenent) for most cellular phones to become cellular scanners. And I'm sure that someone is working on or has already developed a way to decode digital encryption for celluar phones.....it's only natural...something we can''t have, we want!!

My 2 cents worth anyways....

Hi John...

First, dry cells are not really dry. They simply use a paste or gel as the electrolyte instead of a liquid. The typical lead acid battry is a "wet" cell using lead compounds and a sulfuric acid solution. A variation is the "gel-cell" battery. In a way you could call this a "dry" cell, but most do not. Commercial "dry cell" batteries use zinc for the (-) and carbon for the (+) terminal and a paste between them --- your common flashlight "battery". "Alkaline" cells are similar, but use a modified (electro) chemistry. Sorry, but I have forgotten the chemistry details.

The lemon cell previously mentioned is a classic cell example, works well, but will not yield much power (don't try to start the car with it <g>).

443. Was: homebrew Variable Capacitor --> a math based approach?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-13 00:00:00 UTC
From: NOSPAMpfriedr@azstarnet.com
Message-ID: <NOSPAMpfriedr.80.00341ABE@azstarnet.com>
Source record: 87389

Here are some more thoughts on the capacitor question:

lets take two familiar equations for frequency and capacitance:

f=1 / (2*pi*sqr(l*c))

where f=resonant freq of simple lc tuner
pi=pi
l=inductance
c=capacitance
and

c = e*(a/d)

where c=capacitance
e=dielectric constant
a=area of plates
d=distance between plates

Combine them together and you get:

f=1 / (2*pi*sqr(l * e * (a/d))

Now consider this in terms of an analysis of rotor shape: "l", could be considered a constant. "e" is a constant as well. Lets assume the distance between the plates of the variable cap does not change, so "d" is a constant as well. The only variable that is adjustable is the plate area "a", which translates to the amount of overlap between the rotor plate and the stator plate. Lets re-write the equation this way:

f = 1 / k * sqr(a)

where k is all the constants above, lumped together.

Now what is "a"? "a" is the area of overlap, and is itself a function of the angle of the shaft rotation. In other words, the farther you rotate the shaft, the more the plates are meshed, and the greater the overlapping plate area. "a" could therefore be written as a function of angle theta, or the angle of shaft rotation. Lets call it:

a=F(theta)
(at this point we dont really know what that function is, but it actually defines the rotor shape!))

Plug this into the equation above and we get:

f = 1 / k * sqr (F(theta))

Now who remembers any calculus? The first derrivative of a function is its rate of change. (Remember this example: the first derrivative of position (m) is velocity (m/s). The first derrivative of velocity (m/s) is acceleration (m/s^2))???

Anyhow, in a constant frequency cap, the frequency of the tuner should be proportionate to the rotation of shaft angle. The *rate of change* of the frequency with respect to the shaft angle should be a _constant_. Thus, the first derrivative of the formula above should also be a constant.

The final problem is this: My rusty calculus wont let me implement the argument that I just made. The problem boils down to finding the function F(theta) such that the derrivative of f with respect to theta is a constant.

I submit that the same analysis could be done for straight-line wavelength stator curves if the original frequency expression was replaced with the formula for wavelength.

Any comments? Please email direct (my newreader address is spam-resistant) Use: pfriedr@azstarnet.com

Pete

I played about with them some years ago, using a Mot. hyper-abrupt
tuning diode (*very* expensive) and found that they worked quite well.
They also worked fine when tuned by a conventional capacitor. I was
getting a tuning range of about 40 MHz - 70 MHz.

The assumption that the ECH 4G is a hexode only, contradicts
the Philips nomenclature.
Also, it most certainly is indirectly heated.
I went through several Philips databooks from the 40's and 50's,
and came up with a lot of data about the ECH 4 (which is electrically
the same as a ECH 21), but nothing about a ECH 4A or G.
If you like, I can email you the data on the ECH 4.

Gosh it's been 40 years already, in my mis-spent youth which continues to this day, I built a number of valve (tube) regens, I also built a transistor one when they first came out and also knocked up a quick one to listen to the 4m band, I still have it in the loft, minus the audio stage.
To get any stability, you need to use a reduction drive and insulated spindles. The capacitor and the pot need to be behind a good metal screen and as far away from the front panel as you can get them, preferably an inner grounded case is best. You should also have a good ground connection to it. Use of a die-cast box inside of an ali box would be recommended.

I've built some nice gear in my time, my first receiver I built on gaining my license was a 23-valve job, microphonic as hell it was. The transistor/IC rigs have been solid performers, the first synthesized HF 160m - 10m rig was rock solid, great for CW and RTTY, but was a bit on the noisy side, I'd promised to rebuild the synth, but never got around to it. The second synth rig was not quite so stable on RTTY, it drifted a few cycles, but was very quiet, I've had to use the MFJ Super DSP filter on the commercial gear to get it any way near as quiet.
Something went wrong on the TX side that caused feedback, redesign of the driver was done, but didn't cure it, only later I found that one of the PA transistors had screws loose and had died, that's when the penny dropped.

My first commercial rig I got in 1992 (licensed in 1965), a TS450S,
couldn't resist the price in the USA, the following year I got an IC737.

I just started to experiment with different blade shapes. I suspect your reasoning on non-linearity is correct as the last few thousands in distance between the plates is closed there is a dramatic increase in capacitance making it quite non-linear. That non-linearity seems much less when the cap is 100pf or less. My junk box also shows variable caps of differing sizes, but the plate half moons on the rotor and stator are always uniform in size. The only formulas I noticed describe plate thickness, area and spacing, (air dialectric).
I would be interested to hear your progress. Mabe we should just call Digikey and get a few varactors hehe.

Thanks for all the tips on the regens.

Yesterday I received the latest book catalog from Lindsay 's Technical Books. LOTS of info on regens. Must reading for this group! Ask for a catalog:

P.O. Box 538, Bradley Il 60915-0538

Tel: 815 - 935 - 5353
FAX 815 935 5477

Let me ask a very basic question about regen theory.

It seems to me that you can look at the detector as a one stage mixer/oscillator. The RF coming in from the antenna mixes with the "LO" energy produced by the feedback resulting in audio out.

I've seen other explanations that describe the signal as repetedly being run through the active device. This sounds kind of wierd to me.

What do you guys think about this?

from jstrat2323@aol.com (JStrat2323) contains these words:

> or less. My junk box also shows variable caps of differing sizes, but the
> plate half moons on the rotor and stator are always uniform in size. The only
> formulas I noticed describe plate thickness, area and spacing, (air
> dialectric).
> I would be interested to hear your progress. Mabe we should just call Digikey
> and get a few varactors hehe.

Can't help with the formula I'm afraid, but I have variable capacitors with non-semicircular plates on the rotor, They are normally thicker on the 'front' (going from unmeshed to meshed, this thicker end is the first into the fixed plates) and get slowly and progressively thinner as the rotor is meshed with the stator plates. Which ties in with the need for a non-linear taper to avoid bunching.

The curve, I'm sure, would have a mathematical expression (they all do of course) but the best I can say is that they look like the drawing curves from a Drawing Office in any tool making or manufacturing company. Another analogy, which might help (??!!) is the shape of a whale.

Yea, a bit 'off the wall' but you maybe get the idea?

Dave (G0DJA)

I have been experimenting with Motorola MC1648 VCO chips in building a VFO for a receiver project. I have done some of my one stuff and also tried a method used by W7ZOI in which he has the frequency determining circuit coupled to the VCO chip by a toroid coil and several turn link. I get a nice clean sine wave that seems to be determined by the link turns and the stray capacitance in the circuit. My vairable capacitance seems to have some effect, but minimal effect on the freq of the VCO. Any tricks out there? Any of you played with these chips in making VFOs? I would build a hartley or similar, but I have several of the chips and would like to put them to use.

460. Re: A VHF TV dipole

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-13 00:00:00 UTC
From: rcrusoe@aol.com
Message-ID: <19980113173000.MAA05492@ladder02.news.aol.com>
Source record: 87467

In article <69e38rvnu2@alpha.psd.k12.co.us>, slav@psd.k12.co.us (Sam Lavenz) writes:

>I'm looking to make a dipole antenna to recieve the VHF frequencies for my
>
TV. What frequency would that need to be cut for?

Sam Lavenz - KC0BUH

The VHF TV band os nearly 2 octaves wide, so a dipole cut for one channel will not be anywhere near optimum for other channels. Anyway, here's the VHF TV Channels, in MHz:
2: 54-60
3: 60-66
4: 66-72
5: 76-82
6: 82-88
7: 174-180
8: 180-186
9: 186-192
10: 192-198
11: 198-204
12: 204-210
13: 210-216

If you are mainly interested in only one channel, you could construct a real world-beater of an antenna... a cubical quad, Yagi, etc.

Notice that if you take any of the upper channels. 7-13, and divide by 3, the result fits neatly into the lower block of channels. an antenna cut for a particular freq will also resonate pretty near an odd multiple of that freq. So, a tuned antenna for channels 2-6 will work on the upper channels fairly well.

A log-periodic would seem to be a good choice for multi-channel. A tuned loop might work OK.

The frequencies I got from the ARRL Data Book, page 4-3. UHF channels are listed also. CATV channels are listed in the Handbook, in a table for trouble shooting RFI caused by harmonics from ham gear.

Good luck with your antlers!

I correct?

Sounds like you're on to something, Pete. One way to stop all the crowding you noticed is to use a fixed cap in parallel with a smaller variable. The smaller percentage of total capacitance is in the variable, the closer to linear the tuning will be, though the tuning range will be less, of course. Notice that most published VFO designs have a fixed cap in parallel with the tuner, sometimes more than one with different temperature coefficients in an effort to increase long-term stability.

I don't think your goal of perfectly linear tuning is important enough to sweat... If you can achieve anything close to it, that ought to be good enough. Other factors will make calculations a real bear, I'm thinking. you will have to factor in capacitance in series and in parallel with the tuning cap, as inductance. Stray capacitance, too. A linear ttuning optimized cap will only tune in a linear fashion in the design circuit or something very similar, and differences in stray capacitance due to differences in construction technique will affect it also.

I toyed with a similar idea once, that involved variable-geometry stator plates that could be adjusted for more or less linear tuning, with a cam on the rotor shaft operating the stator plate adjust. It got looking a bit too complicated and physically unstable, and I decided that switching capacitors in parallel with the tuner was the simplest way to go to achieve near-linearity, though that necessitates more than one scale on the tuning dial.

If you get a program cobbled together, please share it with us. Sounds like an interesting project for a HBer who really likes to split hairs.

Sure sounds like that is what is happening.

The 1648 is a good chip. Why don't you try the manufacturer's recommended
circuit, then play with the modifications.

From: haynes@cats.ucsc.edu
Message-ID: <69geh9$13t@darkstar.ucsc.edu>
Source record: 87474

See if you can find some old books with illustrations of variable capacitors.

The one with semi-circular plates and the axis of rotation at the center is called "straight-line capacity" (or capacitance) since the capacitance varies linearly with angle of rotation. This does lead to "crowding" of frequency on the dial.

Then in the books you might see pictures of "straight-line wavelength" capacitors in which the plates are not semicircular and the axis of rotation is offset from the center somewhat. If the dial is calibrated in wavelength rather than frequency these give a linear relation of wavelength to angular rotation.

Then you might see pictures of "straight-line frequency" capacitors. These have a very oblong plate shape, and the axis of rotation is very near one end. These are pretty rare.

If you look at capacitors in old broadcast receivers you'll see plates that aren't quite semicircular and have the axis of rotation offset to one side. I remember reading that these were called "midline" or "centraline" capacitors - they are close to straight-line wavelength but a little different to give some compromise at the high frequency end of the dial.

Another way to skin the cat is to use semicircular plates that are not flat. I picked up an old (1920s TRF) receive at an antique swap meet. The tuning capacitors have wedge-shaped cross section to the plates, so that the capacitance increases much faster as the plates are nearly meshed than it does when they are nearly open. I haven't done any reading or experiments to learn whether they are straight-line anything, or are just a reasonable compromise. It looks like the plates were cast to get the non-flat shape.

Message-ID: <69gdmv$5rk$1@news.cadence.com>
Source record: 87477

I have a 20 meter solid state amplifier for 20 meters using a pair of MRF421 transistors. I would like to duplicate the circuit for a total of four MRF421 and, hopefully 400 watts output on 20 meter ssb mobile. The circuit seems easy enough to duplicate. I don't even think the transformers will be too hard but I am not sure how to cascade the output of the two amps??? There is pitifully little info in the Handbook for solid state amps. Once again what kind of a device will I need to combine the 200 watt outputs of two 2 MRF421 amps??
Can anyone recommend a good book or article on the subject of solid state amps for amateur use??
TIA Tony WA6LZH

Cross-posted to: sci.electronics.components,comp.realtime,rec.radio.amateur.homebrew

I have for sale two (2) tubes of Signetics 87C52s, nine (9) in each
tube. These are EPROM versions of the 80C52.

These are NEW, in tube 87C52s, with date code of 9314R.

Exact part number: P87C52EFFFA

These are the extended temperature versions, great for experiments and
robotics.

These devices list for over $25 each, I'm selling at $14 each or tube of
nine for $110. (+ shipping/insurance)

Buy all two tubes (18 total 87C52s) for $195 (+ shipping/insurance).

I would prefer to sell all two tubes, or individual tubes, but will
sell singles if sufficent interest is shown.

These can be used with various monitors (PaulMon, for example) for
learning MCS51 programming and interfacing.

If you'd like PaulMon 2, or BASIC-52 burned in, I can do that for an
extra charge.

I also have ten (10) Intel 8755As, all pulls, various dates (mostly 78
and 79). These are the EPROM versions of the 8255.
Prefer to sell all ten as a bundle, Best Offer (+ shipping).
I'll throw them in if you buy all 18 of the 87C52s.

If you have any questions, please e-mail: jpatrick@ou.edu

Thank You,
John Patrick

All that I want to add is. Radio freq. Move Thru FREE space. They also enter my home and my body. I feel that if these wave enter my home or body I can do with them as I please. This means I can take these waves that enter my home and demod them the way I want. I have a right to know what is in my home, in my body, and in FREE space.

Nuf' Said......

> small quantities).

In Electronics Australia Jan/97 I have presented two universal PLL
modules,
VHF with MC145170 and a UHF with the MC145191, both using the
MiniCircuits VCO blocks.

A quick guide on how to calculate the loop filter values for different
'fref',
and how to measure / verify the PLL closed loop frequency response
(using the
PC controlled DDS Audio Sweep Analyser, EA Mar/Apr96) was presented in
EA Feb/97.
Also in this issue, an example was given on how to drive the YAPLL from
a
DDS source (my earlier YADDS-1, EA Sep/Oct95). The loop filter on the
PLL modules is set for 100kHz fref, ~1ms switching, the noise sidebands
of the
Mini Circuits VCO's do not increase by more than 1dB due to the PLL.

In EA Apr/May97 the new PLL modules were used to extend the frequency
range of
my PC Controlled DDS Sweep Generator (presented back in EA Sep/Oct 95)
to VHF and UHF.

In EA Oct/97 I have presented a heterodyne Sweep Analyser (2xYAPLL +
1xDDS) that
increases the amplitude range of the VHF/UHF Sweeper to 80dB calibrated.
Using a software supression of the first image (5.5MHz CF IF), the setup
can
be used as a very effective Spectrum Analyser, with calibrated frequency
and
amplitude points. In SA mode, 90dB dynamic range is available, 1dB

compression
is +9dBm, with 65dB..70dB 3rd order IM free range. The frequency range
of this
'SA' is whatever the VCO blocks used give (-5.5MHz), thus the setup is
excellent
for testing the modules of a more conventional, high 1st IF spectrum
analyser.

Blank PCB's for the above, just the PLL and DDS IC's, also a small
number of full kits are still available from me - please email for
details.

A demo YADDS Sweeper -DDSWEEP1.ZIP, also drivers for the PLL modules
(*.C + *.exe) - YAPLL.ZIP are available from the EA BBS,
+61(2)9353-0627.

Subscription to EA, and back issues, are available from the EA Readers
Service, +61(2)9353-0620, Federal Publishing Co, PO Box 199, Alexandria
NSW 2015, Australia.

> I hope I haven't zapped it, as it is a surface mount part and has had a bit
> of handling. Are these very tough when it comes to handling etc?
Using the printer port to drive an external circuit can be tricky, a lot
of headbanging can be saved by proper signal conditioning on the receive
end. A series RC and a HCT(!) type schmitt-trigger is very useful,
mandatory on clock
lines. Also, to keep the PC from 'zapping' the driven device
while power to it is not yet applied (if the CMOS device VCC is not
connected,
some printer ports can supply more than 50mA through the interface pins,
possibly damaging the device through a 'latchup' when VCC gets applied)
a series
resistor should always be used. I tend to always use 'true logic' drive
signals,
meaning that the LPT output pins are always 0V when the driver is in the
idle
state.
Until now, I have blown up about 3-4 LPT cards - I have developped a
strong
liking to cards that have a HC374 on output :), although they are
getting increasingly difficult to find. I would not recommend driving
any external experiments from the printer ports of the latest,
integrated LPT port motherboards.

Heat, electrostatic discharge are not too high on my list of dangers, I
have only managed to 'cook' LEDs so far, and 'zap' older type CMOS
devices. Unfortunately,
the new generation of high frequency devices also seems a bit less
robust (they use
10-20GHz 'ft' transistors!). Personally, I've not had any suprises -
lucky I guess... :).

I hope this helps,
many 73

Yeah, I did it to a couple of radios in my pre-license days. Open it up and try to figure out which of the inductors is for the LO. turn the radio on: on battery power if possible, to prevent accidentally getting zapped with 110 VAC. Tune in a station at the top of the AM Broadcast band. With a plastic tuning wand, adjust the inductor. If it is the right one, you will hear the frequency change quite a bit with only a fraction of a turn. If it is the wrong one, probably what will happen is the stationyou have tuned in will get weaker... it is probably part of a tuned circuit somewhere between the first mixer and the antenna, so adjust it back and keep looking. When you find the right one, you should be able tu tune one way and hear other local AM stations, but mostly silence the other way until you get to an active SW band. Do this at night when the lower bands are open. On most older transistor sets, you will be able to get stations up to 5 or 6 MHz. You should have 10 or 20 feet of wire out the window for an antenna since the front end is not optimized for the SW bands, which leads to your next step... the tuned circuit or circuits in the front end must be optimized for the frequency you want to receive. Get back in there and adjust each inductor that looks like it might be before the mixer and tweak it, looking for a peak. Do each one in turn, then go back and do them all again, always carefully tuning for a peak in signal strength.

This is really an academic exercise, and not one to do with a nice radio. You may have a booger of a time re-tuning it.

Many newer radios and most expensive ones are tuned with a DDS or PLL or PLL/DDS hybrid oscillator. Look for a set with no digital readout. A slide-rule type dial is a good sign that the oscillator is a regular old-style LC oscillator.

good luck!

Hi Jan-Martin,

Your post contents the answer as to what a ECH tube should
contain.
The original poster asked about the difference between the
ECH 4 and the A-version of same.
Another poster implied that the G-version might be a
hexode only, and possibly directly heated.
My query showed only data about the ECH 4 without
any suffixes, but with or without suffix, a ECH must always
be a triode/hexode, indirectly heated.

Body handling: Binary attachment payload not displayed: vcard.vcf

Hi, probably looking for a needle in a haystack here, but I recently
aquired a set of 599D twins and need some help. Seems the transmitter
doesn't want to work.... funny thing is, I have located two more sets of
radios locally, and those transmitters don't work, either... the relays
kick and IP and HV voltage are there, the tubes are glowing, but no
dice. Same exact thing with others I found! Some bug in the radio??
seems to be a popular bug. the previous owner has had the radio 20 yrs
(in the closet) with the transmitter broken, so it apparantly broke very
early on.. what could be the problem?? Any help appreciated.
Would also be nice to have the 2m and 6m boards for the receiver,
too, if anyone has them around!
thanks,
Randy

Bob, the big crystals in the bakelite or plastic holders that are held together by screws, I believe they are referred to as FT-243, can be taken out and ground, etched, polished, etc. but make sure you have enough that you can afford to ruin a few before proceeding. You can grind them down by rubbing over a piece of glass covered with jeweler's rouge, toothpaste, or some other very light abrasive, and move the resonant frequency up to about 0.5% of the operating frequency before affecting other characteristics enough to really matter. Patience is called for. Be sure you clean the crystal thoroughly before replacing in the holder. I have only done this once, but I succeded in raising a crystal "almost" to the 40 meter band from I think it was 6912 or some other odd frequency. The crystal stopped oscillating in the circuit, and I never got it working again. I tried placing various capacitances and inductances in series and in parallel but I never achieved dependable oscillation. I never followed up on this. I also ruined a hard arkansas oilstone in the process.

If you are referring to pulling the crystal freq in a circuit, that is easily done with a small inductor and variable capacitor in series with the crystal. I got a 40 meter crystal to pull 10 KHz that way.

Hello--
You might also consider using a 2N2222's collector-base junction as a general-purpose diode. Snip the emitter lead to avoid confusion.

> -John KC0CKJ

A basic lead-acid cell can be made with strips of sheet lead for
the two electrodes, and a water/sulferic acid solution for the
electrolyte. After assembly, a current (dc) is passed through
the cell to 'form' the plates. This establishes the polarity of
the plates.

'Dry' cells are a bit more complicated; access to the chemicals
might be challenging.

Look in your local library, expecially for older books. Many texts
published before the 1950's have more practical 'how-to' information,
although you might find it in somewhat later books.

Good luck!

I would suggest you see RSGB VHF/UHF manual 3rd edition 1976, it shows
some information for 2m.
A proposed coil is 10-12 turns 18swg (or 1mm) enamelled cu wire,
10-15mm I.D., with 2x5pF butterfly cap. I have not tested that this
will tune, but it should not be too far away. Use center tap with a 2k
series resistor for the grid bias, and 2turns 1mm enam cu wire for the
input link.
It is always a risk that your PA will oscillate in TP-TG if you use
chokes in anode and grid circuits. I used a Valvo VK200 anode choke
from center tapped circuit in my 2m PA using QQE06/40, YL1060 or
YL1070 (Linear valve with some increased anode dissipation). YL1060
and 1070 looks almost the same, they have thicker anode connections
than QQE06/40, so you must drill larger holes or get new ones. With
30V grid bias, screen supply for YL1060 is near 250V and 200V for
YL1070. I use 6AQ5 screen grid shunt regulator. 6BQ7/EL84 is a better
valve (need less grid voltage swing for cutoff) as shunt regulator,
this regulator also pulls a relay for timeswitching, such that the PA
cannot be operated before screen regulator is operating.

Easy enough, key the transmitter in the cw mode and then couple some audio to the VFO, I'd use a completly different mic and audio amp, I think to use the existing mic amp would require more work to switch it in than it's worth. The higher the audio level the greater your deviation.

Yea ... get a book on SMD techniques and read it ... you want SMOBC
(that's Solder Mask Over Bare Copper) PCBs ... no solder mask over
Tin/Lead reflow ... it'll wrinkle like hell.

The solder mask is virtually MANDATORY to keep the paste confined to
the SMD pad area, rather than wicking away as it tries to reflow ...

There are several ways to place the solder paste ... stencils are
great ... like screen printing ... but for small, short-run projects
you can get the paste in syringes with a small caulking-gun-like
device that allows you to squirt controlled drops of paste onto the
pad areas. Then you can carefully place the part using tweezers
and reflow with a static hot air source. A heat gun *can* be used
IF you are very careful, but it's easy to overheat parts and even to
blow some of the smaller parts out of position if you get the heat
gun too close to your work.

Do you mean grinding the older FT243 xtals to permanently shift their
frequencies or using more modern crystals in VXO circuits?

If the latter, I can refer you to the Japanese super VXO circuit, which
uses 2 crystals in parallel to get a bigger frequency shift. With
crystals at 10 Mhz, I get 80-90 kHz frequency shift, and that's from the
smaller size of xtals that aren't usually very good for VXO operating.

With a single xtal on 7 MHz, you can normally get between 5 and 20 kHz
shift in a properly built VXO circuit and a HC6/U xtal.

My QRP wep page has links to various home pages that have VXO circuits.

Hello Tony,

The term "cascade" does not mean "parallel". To cascade two amplifiers, is like running water - one waterfall empties into the next, etc.

You are better off not trying to do it by replicating the two circuits and then trying to make them cooperated and work together without fighting each other. It is almost never done.

The classic approach is to put together passive elements in a configuration that is suitable for any number of active elements. Then parallel the active elements in order to get the current carrying capability higher and higher. The only problem is balance. You need enough negative feedback to make transistor to transistor variations get swamped out.

Just take a look at how they use two transistors in parallel and expand that to four.

I don`t think that it is worth the effort, you cant get much fm signal through a cw filter.the rec product detector would have to be switched out and an fm demodulator switched in,quite a chore. I have added fm to some old am 2 mtr rigs but the HW101 is a much bigger chore. good luck Harold W4PQW

Making a standard broadcast radio receive higher than the broadcast station frequencies used to be fairly easy and the benfit was to hear am police radio dispatchers. At night you might hear stations hundreds of miles away. 160 meter ham conversations were there when AM was a popular mode. Also tug boats were commonly heard in the marine band. More recently you might hear cordless telephone conversations. However there is not much to listen to just above the broadcast band now. Single side band is the popular mode. Most phones have gone to highter frequencies. The boats use higher frequencies also.

As an experiment the advice of tuning the local oscillator coil higher is the correct apporach. Good Luck.

The construction of an antenna that is great on all channels is difficult because of the wide range of frequencies used by the tv stations, like the other responder told you. That is why commercial tv antennas have long and short elements. You will probably find that the simple folded dipole made of twin lead tv cable will work pretty good. If the main channels you want to receive are low channels (2 thru 6) cut a piece of twin lead about 6 feet long, tie the wires together on the ends, cut one side in the middle and splice in another piece of twin lead to go to the tv. This dipole will be directional so play with it using thumb tacks on the ceiling or wall for best results. If you want to receive the higher channels (7 thru 13) cut the dipole only about 3 feet long.

Good Luck

It is better to install a Low Pass Filter before you meet
and talk with neighbors about your ham radio.
Designed / Built By JR KB5MER
6 Meter Low Pass Filter Models:
Model#1 Harmonic down 38 dB @ 75 MHZ
52 dB @ 100 MHz
58 dB @ 120 MHz
Handles up to 250 watts PEP $39.00
Model #2 Harmonic down 68 dB through 900 MHz.
Handles up to 2 KW PEP $60.00
* Insertion loss less than one (1) dB
*All part as built to with stand a 4 to 1 SWR
*All test were made into 50 ohm load
* Test made by Austin Radio Lab
Price plus $5.00 shipping & handling Con US.

You do not have much chance of giving a commercial FM station much interference by building a jammer. They have the power, antenna height and efficency in their favor. If you have a beef with that station please express your displeasure to the management instead of trying to whip them technically. They have the right and laws of the land in their favor. You stand to loose a lot more than it is worth. Best Regards.

505. Collins TCS-12 question

Source record: 87424

I'm attempting to repair a Collins TCS-12 receiver, and can't seem to get the tube bias correct. All voltages within the set seem to be correct, and all resistance readings are within 10% (after changing about 15 resistors that changed value). The bias voltage is supposed to be negative (varies with bandswitch setting), but I can't get it below (what my meter tells me) is 150VDC positive. The radio appears to be working OK, except for the RF gain control near it's maximum setting chops in and out. Anyone ever come across this situation before? I've checked every resistor in the set- they're all FB now. Is my meter possibly the problem?

Heh, this is the very sweetness of the principle called "regeneration"
and more modernly referred to as "feedback". Since some of the received
signal is "fed back" into it's previous amplifying stage the signal is
amplified AGAIN, and the feedback path sends some more signal back
around into the input, again and again.... and, properly controlled,
with the operator breathlessly holding his hand (and teeth) just so, and
praying the breeze outside doesn't sway the aerial wire too much, it
results in wonderful sensitivity and even selectivity (compared to
crystal sets and TRF's, not newer superhets with Collins IF filters).
My goodness, thanks for the posts and associated trips to yesteryear!
My regen receiver was built in 1963, while I was feverishly studying for
my Novice license, from the only technical reference I had at that time:
a 1947 ARRL Handbook given me by my scoutmaster, Amos Tietjen. In my
ignorance I then didn't realize I could have built the rig using
"modern" 12AT7's or other available dual triodes, I scoured the Popular
Electronics issues for tube vendors and finally found one that had the
"required" 6C8G in stock. I believe it cost me 85 cents for that tube.

I didn't have sheet metal facilities but my Dad was a carpenter so I built mine on a wooden chassis with a wooden front panel. Can you say Un-Sta-Ble? But it worked! What amazement! What fun! I could copy SSB with that thing and responded with an SWL report to

Tony,

You might try a second amplifier identical to your first amp. Modify the first amp input and output networks with transformers in a push-pull arrangement. The transformers will have a center-tapped secondary winding with each side of center connected to an amplifier. Reverse the transformer for the output of the two amps...center tapped primary with an amp feeding each side of center. Watch for second harmonic spurs. You might need a wave trap for them. I think that is how Motorola did it back in 1975(?) I saw a construction project for that same amp in the ARRL Handbook with a 1KW HF solid state linear.

Good luck and post your results.

According to "Roehren Codex 1951" by Fr. Fritz, the ECH4G is
merely an ECH4 having an octal base.

Hello everyone,
I have a Alinco DR-150. On the full power mode, it can only deliver 40
watts.
Does anyone know how to get more power of this equipment?
Thanks to all.

This should be the explanation, and this is certainly not the only tube to have this dual identity.
In my short form philips data-book , there is the 4689 (power pentode) which is presented both with Transcontinental (elephant foot shaped) and octal base.
May I suggest an explanation for this :
When american tubes became *really* popular in europe, the europeans decided to convert their own tube production to octal socket. This gave the series like :
ECH3 => 6E8MG (MG = metal + glass)
EF9 => 6M7MG
EBF2 => 6H8MG
EL3(N) => 6M6
All the electrical characteristics are the same, excepted socket, and shape.
IMA the transcontinental socket has really contacts and reliability problems.
Although the names of these tubes were "american-like", AFAIK, they were not produced in the states.
But before converting to the final release, (they have to shrink the glass enveloppe in order to make it fit in the metal shield), I guess they first implemented the normal glass enveloppe of the current model (the metalized red-ones or even golden) on the octal base, without changing the marking and the name of the tube.
This could explain why you can find such tubes with apparently the same name, but a different socket. Transition products.
IMA there were the same phenomenon in the U.S , at least for one tube : the 6B7.
6B7 has a US 7 pins base , and the 6B8 is octal based. And you can find some 6B7 with the octal socket, that should be marked 6B8 and are actually marked 6B7.

Conclusion : sixty years after, nothing has changed, when a manufacturer wants to be the first on the market, in the meantime the customer obtain funny products ;-)

Leon,

We switched from the MV1404 to the Sony 1T363. It is a CATV
hyper-abrupt junction varactor that works well at 800 MHz, where the
MV1404 has trouble getting above 200 MHz.

We get over an octave frequency shift with no trouble. The 1T363
costs US$0.50, but Sony sells it only in reels of 3,000. If you can
get some airline attendant to slip some in an envelope on her next
trip to Tokyo, you would have a lifetime's supply!

I use one in a general-purpose HF amp. for test purposes, built on a
scrap of PCB material. It works very well. I put a few turns on a
ferrite bead to make an RF choke, to maximise the gain, rather than
connecting the output directly to the dropper resistor.

Guys My 2 cents
Just received the OHR100A yesterday. Read the QST review on the
100 and found absolutely no fault with the 100A manual and pictorials.
Well written for even a beginner. The schematic is very clear the PCB
is very
professional, Impresive! Looking foward to the assy process and
operation.

Harper College in Palatine, IL will hold their one-day NO CODE Amateur Radio Review Course and Exam on Sat. May 23, 1998. If you or someone you know want an easy way to a License, this is it! Start at 08:30 review Radio, one hour lunch break, review Law and Operating Practices, then take the Exam at 16:30. Every subject on the exam is covered, hence if you have any physics or math background or have a radio background this is the "HAM CRAM " course for you.

Total course including pre-course notes and exam $20.00.

Call 847-925-6996 for details.

Please copy and post at work and on local northern Illinois BBSs and nets.

Thank you;

> What do you guys think about this?
<snip>

Heh, this is the very sweetness of the principle called "regeneration"
and more modernly referred to as "feedback". Since some of the received
signal is "fed back" into it's previous amplifying stage the signal is
amplified AGAIN, and the feedback path sends some more signal back
around into the input, again and again.... and, properly controlled,
with the operator breathlessly holding his hand (and teeth) just so, and
praying the breeze outside doesn't sway the aerial wire too much, it
results in wonderful sensitivity and even selectivity (compared to
crystal sets and TRF's, not newer superhets with narrow IF filters).
My goodness, thanks for the posts and associated trips to yesteryear!
My 1st regen receiver was built in 1963, while I was feverishly studying
for
my Novice license, from the only technical reference I had at that time:
A 1947 ARRL Handbook given me by my scoutmaster, Amos Tietjen. In my
ignorance I then didn't realize I could have built the rig using
"modern" 12AT7's or other available dual triodes, so I scoured the
Popular
Electronics issues for tube vendors and finally found one that had the
"required" 6C8G in stock. I believe it cost me 85 cents for that tube.
I didn't have sheet metal facilities but my Dad was a carpenter so I
built mine on a wooden chassis with a wooden front panel. Can you say
Un-Sta-Ble? But it worked! What amazement! What fun! I could copy
SSB with that thing and responded with an SWL report to HCJB in Quito,
Ecuador.
The kind HCJB folks not only sent me an HCJB card but also an "ebony
letter opener
hand-crafted by local indians" and a picture of Jesus waiting at the
door to be invited
inside. Pure Nostalgia. Do you think I still have any of these

priceless heirlooms?
At age 16 I couldn't envision that stuff ever becoming irreplaceable. I even gutted
my 1927 RCA highboy farm radio my grandmother gave me for "parts", and DRILLED a few holes in it to mount a "hi-fi" speaker so I could use it for a "boom box" wired into my "factory-made" AM radio and rock & roll with KOMA from OK City, the "supercool" DJ squeezing his Rubber Duckie on the mike every few minutes between hits.
The "companion transmitter" I built after getting my Novice ticket was another "Wooden"
breadboard 6L6 oscillator/transmitter. I never made a successful QSO with this combo.
I could tune in 80 meter CW signals, but I only had one crystal and could not zero beat
anyone, and since when I keyed the transmitter I could hear no zero beat, only a raucous roar over the entire tuning range of the receiver, I'd feverishly call CQ blind and then frantically tune back and forth hoping to find some signal transmitting MY call, but no dice. I say I could tune in SSB sigs as well as CW, but only the broader and louder signals could I tune in with any reliability. With a wooden chassis and front panel the mere act of a brother walking behind me would detune the thing, but OH! The hours spent sitting in front of that "system" with the headphones on. It required a 6 Volt lantern battery for the filament(s) and a 45 volt B battery for the plate circuit. Both types of batteries were expensive, and by the early 1960's 45 volt batteries were going up in price and down in find-ability. So, inventive genius that I was, I discovered that 4 'D' flashlight cells in series would run it almost as long as the lantern battery at much less cost and that the new and gaining-popularity 9 Volt "Transistor" batteries were only about 20 cents apiece at the local Gamble's store, so I used 5 of these clipped together in series for a cheapie 45 volt battery.
I DID know the transmitter was "getting out", though..... Every time I keyed it up my Dad would scream (from the living room trying to watch his TV show) "JIIIIIIIIIIIMMM!"
He seemed to think little of my electronics interests in my earlier years. As a matter of fact, I asked permission (for some silly reason) at about age 13 to spend my own money on a set of mail-order headphones from Allied Radio (later to be bought out by Tandy and converted to Radio Shack) that cost $1.50 as I recall. He thought that was unnecessary to my growing-up process and forbade it. I guiltily ordered them "on the sly" and begged my Mom to not squeal on me when they arrived in the mail. Years later, when I was more interested in cars and girls than radio, he came outside and watched me installing a "hotrod V8" (a miserable 239-inch flathead) in my Ford where a reliable 6 used to perform. He watched in silence as I worked and finally asked innocently: "Why don't you mess with radios any more?"
But I digress. I kept that radio "system" for some years and, though I never made a QSO with it, got an "honorable mention" for it as an entry in the Grants High School Science fair. I cannot remember its final fate. It had no recyclable parts I could have used in more desirable

future projects, but it disappeared from view in my comings and goings from college etc. I sure wish I still had it so I could show it off to MY kids and grandkids.... but maybe I'll just try to scrounge enough parts for a "replica". Now, if I can just find the other 6C8G tube left in the world....

We have several GE MASTR II VHF mobiles with the PLL exciter option. Currently set up on 15X.XXX, but will easily move down below 150MHz. These are 65W and 40W units. A couple of them also have UHS front ends. Speaker, mic, cable, head comes with each unit. Radios will be bench tested for functionality prior to shipping. If you want to build a 2m repeater, this is a great radio to do it with. Conversion instructions available. If intersted, please send e-mail to: GWORTH@IBM.NET and also copy ADCJR@AOL.COM (be sure to copy both, as one of us is frequently out of town). $100 + shipping, Postal Money Orders only and sorry but no CODs. Thanks.

George and Al

I have a Signal Generator for sale at $865.40.

Or you can buy a signal generator for only $65.24.

Those capital letters make a big difference, huh?

I think, you are right. Note that it is not usual to declare a socket
different from the base code's one using a suffix.

GO AWAY!!!!!!!!!!!!!!!!!!!!!!!!!!!!

tsunkndj@tickling.net randomly organized the following:
:-=-
:-=- Are you a guy between the ages of 18-23 who is
:-=- HOT, TICKLISH, and IN NEED OF SOME U.S. CASH?
:-=- Or, perhaps, even a new NEC Ready PC with a Pentium Pro
:-=- processor? If so, read on... I'm very serious about what you'll
:-=- find.
:-=-
:-=- UPDATE: Right now, I have 3 NEC Ready 9716 PCs available,
:-=- featuring:
:-=- 56 kbs US Robotics X2 modem
:-=- 4+ gig hard drive
:-=- 32 mb RAM
:-=- Video Card/2 mb video memory
:-=- Built-in Zip Drive
:-=- 24 speed CD Rom
:-=-
:-=-
:-=- Other PC systems are also available.
:-=-
:-=- My name is Terri. I am a female college student in the Boston area.
:-=- As a hobby...one that costs me ALOT of money...I maintain a
:-=- personal collection of amateur videos featuring guys being
:-=- tickled (usually for 30 or 60 minutes) by a girlfriend, good girl
:-=- friend, girl friends, or even guy friends. I am not a business,
:-=- video trader, or porn solicitor. My interest is in TICKLING.
:-=-
:-=- I am actively looking for guys to make videos that I can add to
:-=- my collection. Guys that interest me are YOUNG (basically,
:-=- my age...18-23), HOT (swimmer/soccer/runnerbuilt....on the
:-=- thin side...not too "big-n-buff"....with little or no bodyfat
:-=- whatsoever), and TICKLISH! No sex or nudity are wanted in
:-=- my videos. I just want to see guys tied up and mercilessly,
:-=- relentlessly TICKLED.
:-=-
:-=- If you are interested in this UNIQUE (and hopefully FUN) way of
:-=- making $$$$, please e-mail me. I need you to provide me with
:-=- a general picture (.gifs, .jpgs, .bmps, and pictures found on
:-=- webpage URLS are fine...and I have a mailing address to "snailmail"
:-=- regular photos, also) before I can make you a concrete cash offer.
:-=-

:-=- Average fees paid:
:-=- $125 for a 30 minute video
:-=- $250 for a 60 minute video
:-=-
:-=- PCs are available for multiple video deals and to groups of
:-=- guys (frats, teams, etc) that make videos.
:-=-
:-=- Money offered is determined by your looks, ticklishness, and who
:-=- will be tickling you.
:-=-
:-=- Asian, Black and Hispanic guys are ESPECIALLY welcomed and wanted!!!
:-=-
:-=- I have numerous online references that are available for contact to
:-=- assure you of my honesty, legitimacy, and SERIOUSNESS about all of
:-=- this.
:-=-
:-=- PLEASE NOTE: This is not a TICKLING SERVICES AVAILABLE
:-=- POSTING. I have a boyfriend, full cadre of friends, and plenty of
:-=- guys to tickle already. I AM NOT LOOKING TO MEET OR TICKLE ANY
:-=- GUYS ENCOUNTERED FROM CYBERSPACE!!!! I also do not provide
:-=- videotaping equipment, facilities, or girls to tickle you. All
:-=- aspects of video production are your responsibility!!!!!
:-=-

Message-ID: <19980116143201.JAA12584@ladder01.news.aol.com>
Source record: 87283

I have a Fox Tango (International Crystal) YF88h6.0 AM filter, but do not know how to install it in my TS430 since it is oversized compared to the one thats in there. It's 4 pins will not plug into the slot without some modification. If it just needs to be connected electrically, then that will not be a problem. I had a TS430 some years ago with this setup, but I think that there was a capacitor or two connected across the pins? Any help will be greatly appreciated. Thanks a lot

Can anyone help me with some additional XTAL HOLDER information.

Take a look at what I have so far:

http://www.mnsinc.com/bry/ham/xtalhold.htm

Take a look.

This will give everyone information about crystal sizes for SOME mid-era rocks. What I need to add is data on the OLDER ones like CR-1/A, FT-171 etc.

What about any overseas designations too? We could add them also!

Also, I need some of the newer ones like HC-33/U and HC-49/U etc. etc. Can you help???

Bry, AF4K

I was once very interested in the reflex design. The very first transistor radio I ever owned was a two-transistor reflex receiver. No regen, but the RF amp fed a diode detector that fed back to the RF amp (now doing audio) which finally fed a one-transistor output stage. Enough oomph to power a speaker, but certainly not a "dx" radio. I still remember that it was about 4x5x1-1/2, with a light yellow-green plastic case and a clear plastic tuning knob with gold freq markings...(sigh).

Thanks for stirring the memories.

The first regen that I built, around that time, used a 6V6 beam power tube as the regen, with a coil made from bell wire wrapped around a broomstick handle. It actually worked quite well; however, it also radiated through HF up into VHF and probably into UHF. Many TV channels within a couple of hundred yards just disappeared.

A later version using a high-gain pentode (6BH6??) and a coil on a ceramic form was very sensitive, stable, and selective, without the spurious oscillations. Might have to rebuild one some day.

Here's another regen nostalgia story from about '56 - '57, when Raytheon CK718 (predecessor to the CK722) germanium AF and CK768 RF transistors became available to hobbyists. These were all PNP transistors. I built this radio in a fishing lure box about 2½"X2½X 1¼". Power was two 1½V "N" cells. Coil was a mini BCB "ferrite loop stick" about the size of your little finger. Tuning cond. was a submini 10-365 mmf. with CALIBRATED BC dial about 1¼" in dia. These were from Lafayette Radio of N.Y. A 10-turn tickler was wound on the loopstick. Regen control was a 10K pot., shunting the tickler, coming off the collector of the CK768 (the on-off switch was also tandem on this control). A 3-stage capacity-coupled AF amp using CK718s drove a ceramic piezo earpiece. (A darlington would've been nice!). All 4 transistors were on a common emitter bus, which went through the on-off switch to batt.+.

This was in Young, AZ, a real dead zone for BCB in the daytime. But at night the little regen would really pull in the DX on just a 3 foot whip antenna. KOMA out of Oklahoma City was the favorite.

Live long and prosper

I designed a circuit 10 years ago using TI SN76660N/TBA120
(=Telefunken SO41P) FM quadrature demodulator. max 25mV IF signal was
fed either to limiter input and quadrature detector input, It has much
better quality for AM - in particular during fading, and you could
read signals when they seem to fade down into the noise using standard
envelope detector. SM6HYG Carl-Gustaf copied my circuit and found it
very useful for mediumwave dx'ing

Amidon uses the Fair-Rite identification system. My ARRL Handbook has
a small cross-reference table with Indiana General, Freeoxcube, and
Magnetics. The characteristics of the Amidon materials are available
on the Amidon web page at www.bytemark.com/amidon. With any luck,
Phillips publishes a cross-reference to the Fair-Rite materials.

Bob, take a look at the Motorola RF data book ap notes. They're
full of amplifiers with combiners. It is impractical to parallel
MRF421's because the output impedance is ridiculously low (like
1 or 2 ohms) with just one of them. The inductance of the
traces would kill you if you tried to put two in parallel. BTW,
balance is not a problem if you buy matched pairs, as is commonly
done.

Does anyone remember the reflex Rx? The same stage was used for RF and
AF, and the technique could be used in conjunction with regeneration. I
built a simple pocket-sized regenerative/reflex AM Rx about 35 years ago
using a Mullard OC170 VHF Ge transistor. The reflex technique was also
useful at IF, for a superhet. One basically took the output from a diode
detector, and fed it back to the input of an RF amp. I think that the RF
amp had a load resistor (for AF) and RF choke (for RF) in series. The
technique worked quite well, and saved an AF amp stage.

This base is normally called 'side contact' in English.
In German 'Topfsockel' as it resembles a pot. We Norwegians
call it similarly 'brønnsokkel'

and
> octal base.
>
> When american tubes became *really* popular in europe, the europeans

> the series like :
> ECH3 => 6E8MG (MG = metal + glass)
> EF9 => 6M7MG
> EBF2 => 6H8MG
> EL3(N) => 6M6

This is only partly correct, the types you compare are French
tubes. They are unique(Ref.Vade Mecum manual)and only similar to others.
Gerard Tel asked about the 6E8MG,6M7G and 6H8G some
two years ago, and there was a whole discussion here about where
these quasi-american type numbers came from. They are made by Mazda
in France, and probably had no second source.

If you compare Philips databooks, you will find:

ECH3=> ECH33 (35)
EF9 => EF39
EBF2=> EBF32
EL3 => EL33

These are in all ways equal, apart from octal bases instead of
side contact. Also, the older ones' top contact are big (3/8 in)
whereas the octals e.g. the EBF2 has a small one (1/4 in)

> > IMA the transcontinental socket has really contacts and reliability
> problems.

Yes, you have to burnish the contacts when restoring an old set.
I use a micro-drill with a small brush.

> Although the names of these tubes were "american-like", AFAIK, they were not produced in the states.
Yes, you said it!

Brad,
I experimented with that years ago and the best I was able to
acheive was up to around 2 Mhz. Lousy sensitivity. Those cheap radios only
needed enough sensitivity to pick up local stations. The only way to modify
these type radios was to retune the front end. The IF sections were always
staggered 455 and 10.7 cans. Never found a way to modify those mini plastic
tuning caps not to mention that ferrite bar antenna. I finally gave up
thinking a converter would be much easier to build. Now you have a choice
as to which band you want to listen to and building a simple SW receiver
using the NE602 IC. I saw projects in 73 that look interesting and you
would be doing yourself a big favor and avoid a lot of frustration by using
the 602.

Not only : I have 6E8MG,6M7G,and so on also made by Tungsram, Visseaux,
Neotron with metal shield covering an inner glass enveloppe. For
example, Neotron was a "real" manufacturer, not a re-saler, I have some
french funny advertising from them, dated of the late 30's.
My datas about the previous list are extracted from a Philips data-book
"Tubes et semi-conducteurs" - 1971. Quitefrankly the tubes are *not*
listed as equivalent (and I haven't said that in my previous post), but
have the same electrical parameters.
I have also some 6J7MG, 6J5MG made this way ..more interesting for
audio, eh..eh..
BTW,I grant you that I have never met a 6E8MG made by Philips.
> If you compare Philips databooks, you will find:
>

I also have ECH3 and others of the serie branded "miniwatt" which was
,if my memory is right, a French Philips subsidiary.
Got several "Miniwatt" 6M6 too, - strangely enough the plate has not
the same shape as the EL3N. (which, IMA, is pretty linear in triode
mode).
Also I have several 6E8G and others of the serie, glass bulb,covered
with golden conductive paint, octal base, tungsram branded which should
fit your equivalent list.

Best Regards
Pascal

AFAIK, Miniwatt is the Philips designation
for lower current filaments, the first of them
came out in 1926.
After that, and the introduction of indirectly heated
tubes, Miniwatt continued to be stamped on Philips
tubes.
I've never encountered a Dutch Philips without
the word "Miniwatt" stamped on them.

UY1 and UY 1 N (1942).
The latter being a Philips (Valvo) type only,
but no difference at all with other brands.

I found a reference in the 96 Handbook, 15-32. A complete circuit, parts list, construction tips and theory of operation are presented. The main components are the NE602AN and NE604AN. I have never built this circuit, though I intend to include it if I ever get around to building the "Great American Receiver". It looks workable and is definitely do-able. Alignment CAN be accomplished with just a DVM, and the article holds the builder's hand pretty well through the whole procedure.

If you happen to build this circuit, I would sure like to hear of your results. Good luck!

GE MASTR II VHF mobiles with the PLL exciter option.
Currently set up on 15X.XXX, but will easily move down below 150MHz.
65W and 40W.Several of them also have UHS front ends (pre-amp).
Speaker, mic, cable, head comes with each unit. Radios will be bench
tested for functionality prior to shipping. Some regard the MASTR II
as the ultimate radio for repeater conversions. Conversion instructions
available. If intersted, please send e-mail to: GWORTH@IBM.NET and also
copy ADCJR@AOL.COM (be sure to copy both, as one of us is frequently
out of town). $75, Postal Money Orders, + shipping. Thanks for your time.

587. Trade for tuner or QRP rig

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-17 00:00:00 UTC
From: shephed@aol.com
Message-ID: <19980117181700.NAA02279@ladder02.news.aol.com>
Source record: 87310

I have a Asus TX97-X ATX motherboard I would like to trade for a turner or a QRP rig.

The boards features are:
Runs Intel Pentium (MMX) 75 to 200 MHz, Cyrix P166+, AMD-K5 (PR75-133MHz). (No CPU installed)
512K pipelined burst cache.
Intel's 430TX PCI chip set.
Built in Creative Labs SB16 sound card.
PS/2 Mouse, and keyboard sockets.
USB ports.
Full onboard I/O.
PCI Bus Master IDE controller.
3 DIMM memory slots. (Comes with 16Meg of SDRAM installed)
4 PCI / 4ISA slots.

I also have a 1.2GB hard drive to work on a trade.

Hey

I'm thinking about building a 6 meter SSB receiver and transmitter.
Does anyone know of any kits or plans for building one. I have found
kits for transverters but I don't own a HF rig and only have my no-code
tech so i'm not planning to buy an HF rig anytime soon.

Thanks for any help.

>
>Richard

That's not a good idea, Richard. Put a *dot* of solder paste on each
pad (just a little bit). Set the chip on the pads in rough alignment. And
use a *static* hot air source. A heat gun is too violent, and blows a
stream of corrosive hot oxygen. Use a torch with an appropriately
sized and shaped heat shroud. The torch exhaust is practically oxygen
free, and the heat shroud will create a sufficient static zone. The Weller
Pyropen Jr is a suitable torch for this size chip. Let the surface tension
of the molten solder pull the chip into perfect alignment on the pads.
This should only take 1 to 2 seconds. Don't overheat.

590. ID Primary on PWR XFMR for tube gear?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-17 00:00:00 UTC
From: rcrusoe@aol.com
Message-ID: <19980117183800.NAA05161@ladder02.news.aol.com>
Source record: 87313

I have a handful of old transformers from tube TV sets, phonographs, etcand I could figure out what was what if I can just identify the primaries. None of the leads seem to correspond with the color codes in the Handbook.

I have two brown wires that show 81.3 ohms across them, and I think they might be the 110v primary. Anybody have any ideas how to proceed? should I just hook up 110 VAC through a half amp fuse and test the voltage on the other 12 leads?

I have a bunch of old tubes, including a 6146B I would like to use for a CW transmitter. I only have a few of these transformers and I don't want to melt down more than one or two at the most while I figure out which leads are which windings at which voltage.

Does that resistance sound typical of a power transformer primary pulled from old tube gear? Any advice or ideas from OMs familiar with hollow-state electronics are appreciated.

Dang Bob, I totally agree with you. I recon it's ok to advertise used radio stuff on these NGs insted of the swap/sell NGs but not commerical ventures. Folks like Wilber are probly misdirected by these other offers. I don't know where Leander, Tx is but I betya it doesn't have much of an outlet for advertising for the small OEM feller. I have a small business as a computer consultant and would never advertise my business in a discussion news group. In fact I vow to never make an intellegent statement in a discussion news group. But I've been known to lie (an weight).

```
Below is the latest index of L.O.S.A and you can download the
complete L.O.S.A from the following places...

WWW:

http://www.hth.com/losa.htm

FTP:

ftp://ftp.parallaxinc.com/pub/text/losa.txt

1.0 Whats is L.O.S.A all about ?
--------------------------------

I started to compile L.O.S.A because I know there are lots of great
ideas and many problems that are solved with the BASIC Stamp and the
main purpose of this list is to get an idea of what other people are
using their BASIC Stamps for and maybe get some inspiration or hints.

1.1 How can I contribute to this list ?
---------------------------------------

If you have done something (big or small) with the BASIC Stamp that
you are willing to tell others please use the form given below and
write a short description, nothing fancy is needed just a simple
explanation. If you have source code to share that's even better but
it's not necessary.

Visit the following Web site and fill in the contribution form...

http://www.hth.com/losa.htm

Lots of folks like to listen to military communications, and a missile
test would be a great oppourtunity to hear the unusual. I will aggree
that the radio equipment groups are the wrong place to post such info.

David:

The missile launches from VAFB are often spectacular and seen over
thousands of
square miles. As launches are infrequent, monitoring the event is a rare
opportunity.
The men and women at Vandenberg do a remarkable job.

As a matter of coincidence, the payload *is* radio related.

Monitor Safely!

The 80+ ohms you read would be too high for any primary I have incountered. Did you find any lower? Because there are few turns on the primary, and because the entire current capability of the transformer must flow thru it, the primary is usually heavy wire and few turns= low resistance. What other resistances did you find? The ratio can be helpful in getting some idea of the number of turns/voltage.

I have an old Panasonic NV333 video recorder and I was playing a tape
and thee picture changed to snowey background. I then lloked at the
tape and it looked a damaged.

I then tried another tape and it looks like the picture has gone on
all tapes but sound is ok

My manual tells me that if this happens the video heads are "clogged".
How do I unclogg them. I have tried cleaning them internally but had
no effect

Thanks for any help

Some sources claim that the Amidon dust iron cores are made by
Micrometals, at least the specifications and numbering seems to be
identical to Amidon. The Micrometals' cores are more easily obtainable
at a lower cost here in Europe than the equivalent Amidon types.

Fair-Rite make ferrite toroids, EMC suppressors with six holes etc.

606. Hardware Cloth??? What is it?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-18 00:00:00 UTC
From: Dwight Stewart <stewart@sccoast.net>
Message-ID: <34C28910.4C4@sccoast.net>
Source record: 87180
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.homebrew

I'm seriously thinking about building an antenna (the construction is described in a book I have). However, the instructions say to use of two phasing sleeves made out of "galvanized iron hardware cloth."

What is "galvanized iron hardware cloth?" What is it normally used for (so I will know where to look for it in a hardware store)?

And could it have another name that might be more familiar to hardware store employees (and me for that matter)?

I went to a local hardware store to ask about this and they just looked at me like I had just landed in a flying saucer (in other words, they had no idea).

Any help is appreciated.

Dwight Stewart (KF4URZ)

It's a 'standard' EIA NC tape format.
% = start of tape (tape reader will ignore everything before this, there
should normally be one at the end of the tape as well)
M30 = end of tape and rewind.

I don't think you need to know anything othere than you have already
except what size of drill is expected to be loaded for each tool number.
I think most PCB systems also produce a documentation file listing the
drill sizes expected.

In my opinion it is a very good book (although it says that TBA120S is good for meteorscatter converter, I believe it is not). The book shows many very good ideas you will never find elsewhere. But I also like to have several other books....like RSGB VHF-UHF manual anno 1976, DUBUS handbooks (the first in the series is best), The dutch VHF/UHF Handboek, UHF Unterlage and many more

The most important point - but unfortunately often not understood by the authors - for any handbook is to provide and distribute printed circuit boards for projects discussed.

A mediocre circuit will almost always be chosen provided a pcb is available. G4DDK designs ufb circuits and PCBs, but are pcbs readily available?
I once tried the RSGB multi oscillator "UHF source" (every stage oscillated), I started to build two units, and they were a complete disaster - primarily because of nonexisting impedance matching from each transistors to the tuned circuits.

I think you have this backwards. R2 needs to be small compared to R1.
But not too small, or the loop will be unstable. Usually R2 ends up in
the range of tens to (at most) hundreds of ohms, while R1 wants to be in
the tens to hundreds of K.

Also, an LM324 is not a good op-amp for this type of application. The
data sheets are vague on this subject, but one graph of its large-signal
frequency response suggests that at 32 kHz it may not be capable of
swinging 10 volts. If that's true, then it could well be acting as an
undesired pole in the loop filter, causing instability. I'd use an
OP-27 or at least an LF356 or something instead of the LM324.

See my note to Joe. At the very least, if you want to use an LM324 in
this circuit, you should try feeding it from a function generator at 32
kHz to see if it is capable of delivering a useful 10V output swing.

Do you really need .2 v more? I'm not an expert on Power supplies, but you
should be able to do it. The difficulty invloved will vary on how it's
designed. A switching PS will be more work...

Are you running radio equipment? I really doubt that .2v will matter much.

Try a lumber yard. Another name is goes by is "hail screen". I
have seen it in 1/8 and 1/4 mesh. I think you want the 1/4"
unless you are at pretty high frequencies.

Hi Dwight, you can get it at almost any large hardware store like Home Depot. It is the stuff that rat/mouse cages are made out of. The 1/4" square (approximately) openings are made with wire that looks like it has been dip soldered. Properly supported, it makes pretty good ground planes and top hats. If I get time to put up a 100 sq.ft. hardware cloth top hat at 13.5 ft. on my pickup, I'm sure to win the next mobile shootout.

At high-school, we made lead-acid batteries the same way electrolitic capacitors are "rolled up". The lead plates were 1/16" thick, 4" wide, and 24" long. Sandwich loose weave paper or card-board between them to prevent shorting, then roll 'er up into a solid cylinder and put into a round plastic container of matching size. Attach terminals, then fill with dilute H2SO4 (sulphuric acid diluted with distilled water). Can't remember concentration, but it's the same as in car batteries. Then charge for a few hours until continuous gassing.

This cell gives lots of oomph and can lift chairs with an ungeared motor. Try using thin, longer plates for higher current, and wire 6 cells in series. It would be impressive to start a car with one!

John is right about the resistors...I was typing faster than I was visualizing.
My bet, though, is that R2 will be in the order of K's when R1 is 10's of K's.
As far as the OpAmp, I don't think it will be a problem unless the loop bandwidth

is made fairly large compared to the OpAmp bandwidth. With a 32 khz reference (I
got this wrong in my previous post too....I said 4 khz), the loop bandwidth is
probably gonna
have to be less than 1000 hz to get good filtering of the reference, so the OpAmp

probably won't be a factor. Still, a good ,fast, low noise amp would be better
design practice.
Personally, I don't like amps in my loop filters unless I need the gain or
buffering. KISS principle
seems to work best.
By the way, the tuning range (1.1 to 1.3 MHz if I recall) is only about a 20%
ratio. A good
modern hyper-abrupt tuning diode (see the Motorola MVAM series) should easily do
this with
less than 5 volts of tuning voltage, possibly eliminating the OpAmp. I've made
VCO's that tune
more than a 3:1 range (with 15 volts of tuning voltage) using these diodes and a
CMOS gate oscillator.
One trick to extending the tuning range on any low frequency VCO is to keep the
Pk to Pk RF voltage
on the varactor small so that the diode does not rectify the RF.

Source record: 87192

Thanks to both of you for the reply.
I have several stupid questions:

1)Why does the bandwidth of the LM324 matter?
I have it after the loop filter.
The 324 only needs enough bandwidth to follow the frequency response of the loop filter.
Is this configuration my problem.....

2)I don't care about lock time, seconds is fine.
So if I set the time constant of R1C1 at 300Hz (100 times lower than the refernce frequency) Do I even need R2? I currently have just the R1 and C1.

Any suggested ballpark values for R1,C1,R2?
The two responses disagree about for R1>R2 or R2>R1.
I am going to add R2 and try R1 >> R2 about 100 times.
How good does the filter cap C1 need to be?
I have some good polyester caps to
.47uF
good mylar films to 2uF and good tant's to 47uF.

I've done loop stability the analytical way. (Many Many moons ago while getting my engineering degree, but I haven't done a laplace transform in 18 years.)
I can model the response of the loop filter, and the VCO, but
what is the proper model of the divider and phase detector?
I believe that the if I just divide the Mhz/V scale of the
VCO by the divder ratio I have that one covered, what about the phase detect?

Thanks a million for the quick response.

Paul(KL7JG)

P.S. the way I am detecting the loop instability problems is:
1)Looking at the filtered loop voltage with a scope.
2)Looking at the two reference frequencies with the scope to see if they are in sync. (They are not)

P.P.S
The PLL is for a LW DGPS reciever.
I've created a simulated baseband signal with S/N of 3db and recorded it on a casette tape and sucessfuly decoded it with my DSP
hardware/software, now all I have to do is get a simple I/Q direct conversion reciever to work ;-)

I'm not familiar with this power supply, but here is an idea assuming it
is a linear supply. Add a diode to the ground leg of the voltage
regulator. That should give you a bump of 0.4 to 0.5 volts. Would that
work?

Hardware cloth is a woven wire screen. Usually 4-mesh (1/4-inch spacing),
but sometimes available in 1/2-inch (and maybe others I don't know about.

The people in your local hardware store don't know their stuff. If no one
(not just one employee, but all) at the store never heard of hardware
cloth, I'd be looking for another hardware store.

Hello, to ALL homeonwers!! If you are paying mortgage on your
home, I can offer to you a FREE BI-WEEKLY MORTGAGE PAYMENT SERVICE. It's
absolutely FREE. This service WILL:
cut years off your mortgage term, save you thousands on mortgage
interest alone, and make you a homeonwer much sooner. For
more details go to my website at:
www.freeyellow.com/members2/kipijr

This service is 100% lender approved!!

Thank you,
Dean Kipi Jr.

I recall a recent request for a number of AMD AM-7910 300/1200 baud IC Modem chips ("world chips") posted by several people on these newsgroups.

Halted Specialties Co. in Sacramento has a bunch of them! New, static foam storage single pieces. Counted ten or more behind the counter, possible that they may have more in the back. They also have 2.4576 MHz crystals and other IC's to complete the simple RTTY/Packet Modem described in the 1988 (and other years) ARRL Handbook.....

Tony,

Try getting your hands on a Motorola RF Data Book (last printing consisted
of two books in a set), they have all the info you need to combine (not
cascade)
the two sets of amplifiers. They have a applications sheet on using four
300w
linear amplifiers to produce a solid state (50VDC Vcc) 1200w amplifier for
2-30 Mhz.
Do a search for Motorola on Yahoo and it should lead you to their web site
where
you can find information on how to order this data book...

628. Re: ID Primary on PWR XFMR for tube gear?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-18 00:00:00 UTC
From: n2ey@aol.com
Message-ID: <19980118015101.UAA06597@ladder02.news.aol.com>
Source record: 87231

Hello Robinson,

Here's what I do to identify old power iron,

First, take ohmmeter readings of ALL the windings and make a sketch. You'll probably find some windings that are very low resistance, which are obviously heater windings, a relatively high resistance winding that is center tapped (full wave rectifier/high voltage) and then a medium resistance winding that is probably the primary. To make life interesting, the primary may be tapped to permit operation with various line voltages.

Next, hook up a Variac and a fuse (1 amp or so) to the suspected primary windings and put an AC voltmeter of adequate range on one of the suspected secondaries. Gradually raise the input voltage, and see what you get. It's typical for an unloaded transformer to read 10% high or so - 6.3 volt heater secondaries showing 7+ volts, fr'instance. If things seem way out of whack, you've probably guessed wrong on the primary leads.

No variac? Try a low wattage lightbulb in series with the primary. This is not as exact, and requires more skill in interpreting the results.

If it still doesn't make sense, take off the transformer end bells and try to figure out which winding is nearest the core. Almost all manufacturers put the primary on first, to reduce copper loss. (The primary handles the most power, and being closest to the core means the least length of wire, and hence resistance, per turn).

Of course the real trick is to identify and mark the wires before removing the transformer in the first place - but I had to learn that the hard way, too!

Naturally, observe EXTREME caution in handling the potentially LETHAL voltages involved. It's not uncommon to find transformers with dead shorts from one or more windings to the transformer case, rotted insulation, really HIGH voltage windings, etc.

Hope this helps. Feel free to email for more info.

>electronics are appreciated.

Well the first thing to do is to stake all those leads down where they can't
fly around and zap you or short to each other. I usually use a board with
a line of brads driven partially into it as a terminal block. A real terminal
block could be used too.

Identify the windings with an ohmmeter so you know which lead goes with
which. And note any that appear to be center taps. Then find the pair with
the lowest resistance. This will almost always be the filament winding.
Apply 6 VAC to this winding from another filament transformer which
you've set up with a low wattage light bulb in series with its primary,
and carefully measure the voltages which appear across the other
windings. One pair should have about 120 VAC across them. That's
your primary.

The reason you want to do things this way is that the external
filament transformer acts as an isolation transformer in case
there is a winding shorted to the core in the unknown transformer,
and the light bulb acts as a current limiter in case any winding
has shorted turns (not the same thing) in the unknown transformer.

Amidon uses Fair-Rite's identification for their ferrite cores. For
powdered iron cores, they use Micrometals. I believe that their cores are
made by these manufacturers.

I missed the original post. Are the leads color coded?

-

There are about 14 solder lugs sticking out of the transformer, and a bunch of wires soldered to them that don't seem to match the color coding in the ARRL handbook. There are no actual colored leads coming out from the windings. I'm going downstairs to get a beer now, and when I come back, I'm gonna check the resistance of each lead against each of the others and try to figure out at least which are the primary and any input voltage adjustment taps. I haven't really done that systematically and recorded the results yet. The biggest one weighs about 4 lbs and stands about 3 inches tall, and supposedly came out of an old phonograph that used tubes in the audio amp. I am hoping I can use it with a 6146B in a CW transmitter. If not, well... I got a couple of 1S3's too.....

Message-ID: <34c166e1.0@newshost.pcug.org.au>
Source record: 87237

Timothy - I'd suggest you consider DSB rather than SSB - it's much easier to build and most people wouldn't know that you've got two sidebands. I would also suggest a VXO-controlled rig. The 6m DSB rig in Solid State Design is about as simple as you can get. The only thing I'd add to it is a VXO and maybe an extra linear amplifier stage. I've had good results with the linear amp chain from that circuit with a DSB rig I built for 7 MHz.

As for a receiver, I'd suggest you build a direct conversion or superhet receiver for 20 metres and get that going first. Then add a converter using a 36 Mhz xtal for 6m. These xtals might be available off the shelf so should be fairly cheap.

635. Re: ID Primary on PWR XFMR for tube gear?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-18 00:00:00 UTC
From: rcrusoe@aol.com
Message-ID: <19980118041900.XAA20146@ladder01.news.aol.com>
Source record: 87238

OK, here's what I got. The transformer I want to use seems to have 4 windings. I'll call them windings A, B, C, and D.

Winding A has a total resistance of 20.7 ohms.
taps at 19.4 and 19.9

Winding B has a total resistance of 22.7 ohms
taps at 21.1 and 21.8

Winding C reads 0 ohms
There is one tap

Winding D has a resistance of 81.5 ohms
There are no taps on winding D

Measurements were made with a cheap Radio Shack pocket digital VOM. The readings across the taps also read short and I only got a reading when I went from the one end to the taps. The meter simply just doesn
t read anything under an ohm or two. I guess I could make a bridge of some sort, but I mainly want to find the primary, hook it up, and find the output voltages. The exact resistances I only needed to find the primary.

I guess it's a given that Winding D at 81.5 ohms is the high voltage output, and winding C that reads short on my meter is for the heater filaments, but windings A and B are pretty close.I wonder if A:B is used as an isolation transformer for supply to the turntable? Both windings A and B go waaaayy, way up inside the transformer.

Anyway, it seems that either A or B must be a 110 VAC primary with taps to allow use of 115 or 120 VAC. So... which one? Does it matter? Do I have to just smoke test the thing and tolerate a 50% chance of cremating the transformer?

Any help will be appreciated.

Wouldn't a lower voltage be fine across the presumed primary, then
extrapolate from what you see on the other side.

e.g. 10vac across the presumed 110 primary = xxx output

Gday all

I am in the process of attempting to design a repeater front end board for 146 MHz. In Australia we have high power pager transmitters on 148-50 MHz with EIRPs of around 1 KW colacated with our repeater antennas. Not surprisingly there are problems, probably often related to overload. I was proposing to use a AD831 mixer and a strong RF amp Anyone got any ready made circuits for the RF amp? (or other comments)

Gain 10-12 dB

Max output before distortion around +10 dBm

Reasonable noise figure

Richard VK6BRO

I finally got the receiver portion of my 30 meter direct conversion transceiver running. The lineup is: NE602-MPF102-LM386. I have two tuned circuits in front of the 602. Transmitter is a 5 Watt W1VD VXO controlled rig. Got the VXO signal to pin 6 of the 602 via a couple of turns of wire around the toroid in the TX VXO buffer stage. (I'm just guess-timating the level - I'll rig up some means of measuring it soon, but so far it sounds good.) The Audio amp is behaving itself and is not squealing.

My current problem is that I'm being clobbered by shortwave broadcast station. Radio Korea, Radio Canada, Christian Science monitor and others all take turns! They are there even when I turn off the VXO.

Any tips on getting rid of this interference?

If this is the tool that uses self-fluxing wire you can buy a similar
tool (the Roadrunner) and wire from Farnell. Maplin stocks the similar
Verowire tool and wire.

Thanks for posting this, Bill. I got a good link to a Hewlett-Packard PDF file on basic LCR measurements.

Funny - while I was browsing his site, I came across a link titled "Design Considerations in High-Speed Circuits". As I had a link on my page with the same title, I was curious to see if the author had anything interesting to say.

It turns out it was my page!

http://www.csolve.net/~add/system/hispeed.htm

Hmm.. I was going to take it down since there seemed to be no interest. Maybe I'll keep it up. This guy really gets around :)

There is a good chance that winding C is the filament winding. Connect it to a 6 or 12 volt transformer through a 6 or 12 volt light bulb. Then measure the voltages across the rest of the windings. This should give the voltage ratios of the windings anyway. Be careful, even with the current limitig there could be fatal voltages present.

You might try one of the broadcast band filters like the one in the ARRL
Handbook. In the 96 edition it is on page 16.36.

Do you have your project in a box yet? Amazing what a difference it makes to
have a little shielding sometimes.

I vaguely remember doing an experiment in high school where we made our own dry cell. The container was a hot dipped galvanized metal pipe and the carbon electrode was made from carbon welding rods. These have a copper coating on them that must be removed. I think nitric acid was used for this. leave a little copper on one end to attach the electrodes. The ends of the cell was plugged with wax.

655. How to Convert 2 meter amp to 6 meters?

I've put details of a simple, low-cost DIY DSP system using the ADI
ADSP-2104 up on my Web site:

http://www.lfheller.demon.co.uk/diy_dsp.htm

I wire-wrapped it on a 100 mm square piece of prototyping board, and it
cost me about #35 for the chips (the ADSP-2104, AD1847 codec and a 2K X
8 NVRAM), which are all available from Maplin, in the UK.

>just smoke test the thing and tolerate a 50% chance of cremating the
>transformer?
>
>Any help will be appreciated.

I'd bet that A and B are 110 volt primaries, with taps for line voltage adjustment. Put them in parallel for 105/115/125, and in series for 210/230/250 volts. Although the resistances are slightly different, that may be due to the fact that one winding is inside the other. The entire winding is used for areas with high line voltage (125), the taps for successively lower voltages. The fact that there are two nearly identical windings leads me to believe that they are both primaries, as described above.

Next test is to put 110 AC on winding A and see what voltage comes out of the others, with no load. If A and B are primaries, the voltages should be EXACTLY the same. That is, the voltage out of B should be exactly what is going into A.

I'd agree with your guesses on windings C and D.

This transformer may or may not be your best bet for a boatanchor transmitter. The lack of a centertap on the HV winding means you can't use the "economy power supply" trick to get two high voltages from one transformer and one bridge rectifier.

Of course, use adequate fusing. Yes, there is a definite "smoke" factor involved, but that's part of the boatanchor game, I guess. Remember Murphy's Five Thumb Postulate:

"Experience varies directly as amount of equipment ruined."

For measuring low resistances, you can also use the "battery and two meters" method. Hook up a dry cell or power supply of known low voltage (say, 1.5 volts) in series with the winding to be tested and an appropriate range ammeter or milliammeter. Then read the current through the winding, and the voltage across the winding, using a second meter. This method requires that you know the approximate resistance beforehand, but is more accurate than most inexpensive ohmmeters.

Good luck & play safe!

664. Help Simple VCO/PLL problems....

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-18 00:00:00 UTC
From: Paul Breed <Paul@rasdoc.com>
Message-ID: <34C247D4.B1A0F8AF@rasdoc.com>
Source record: 87267

I am trying to build a synthisizer with the following specifications:

1.128 Mhz to 1.304 Mhz with a step size of 4 Khz.

I've built a Colpits VCO using a 2N2222 and a Toko shielded 1.5uH coil,
that runs at 8 times the desired frequency.
The frequency is varied using a pair of 68pF Var Cap diodes from Zetex
Digi Key part ZC835ACT-ND

The VCO is buffered by a second 2N2222

This is all controlled by an MC145157 PLL chip (Running on 5V).
The PLL reference frequency is 32Khz.

The output of the PLL is RC filtered and then sent to a LM324 Opamp with
a gain of 3. The system does not seem to be stable.

I've tweaked the values of the VCO so that 2 - 12V on the Varicaps
causes the vco to cover the desired range.

As I vary the RC constant of the Loop filter it just seems to
vary the loop osscilation frequency. I've tried cutoff frequencies from
2Hz to 1KHz.

The entire circuit is built on a ground plane, but there is not much
element to element shielding.

Any suggestions? I can send a GIF schematic to anyone that is
interested.

My test equipment is limied to :
A very good 175Mhz LeCroy digital Scope, and
a good DVM, I do not have a General coverage reciever, or a frequency
counter. (Other than the markers on the scope)

666. Gerber drill file format?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-18 00:00:00 UTC
From: Nick <Nick@no.spam.for.me.ta>
Message-ID: <69tnos$390$1@heliodor.xara.net>
Source record: 87269

I would like to build myself a homebrew PCB drilling machine utilising the mechanisms from a couple of old image scanners.

Does anyone have, or can point me in the direction of the file format for a GERBER drill file. Most of it is self-explanatory though there are a couple of items I don't know.

Example of drill file (just 3 holes) from my PCB designer:

```
M48
%
T001
X00800Y00323
X00400Y00023
T002
X00100Y00323
M30
```

T=Tool no and X,Y are position in 1/1000" but I don't know what the "M" or "%" denote. All files seem to start with "M48" and end "M30".

Any help appreciated.

Thanks & 73

Paul,

I assume you have a passive loop filter before the opamp. Topology probably looks like this:

```
Res (R1)
>-----/\/\/\/----------------------> OpAmp
|
----
---- Cap (C1)
|
/
\ Res(R2)
/
\
|
== Gnd
```

R2 will probably need to be large compared to R1 (5 to 10 times for starters). Increase R2 until loop is stable.
Then, if you have problems with 4KHz whistle (modulation of VCO by reference), add small amount of capacitance across R2. Juggle these values (R2 and its shunt Cap) until you have a stable loop with minimum 4khz whistle.
You didn't say if you're looking for tuning speed or not. The R1*C1 time constant will determine that. Other parts will determine "damping" or stability. Of course there's a scientific way to arrive at these values, but the method I described will get you there without having to know about the complicated math. BTW, make sure that the OpAmp has a very high input impedance. Any leakage cuerrent into or out of the loop filter will cause the phase detector to put out wide correction pulses that will make the filtering problem more complex.

I believe a friend tried to buy from USA and his letter was forwarded
to the Norwegian representative....., as happened for Heath Kit, Bird
and several other, some has the representation and they have monopoly
and decide to charge high prices. Amidon is offered at very high
prices in Germany. Sometimes prices may be and lower in UK.

A danish friend is selling VHF/UHF transistors, the actual prices for
scandinavian amateurs are reasonable, and when we go to German VHF
conventions he charges the same amount in Deutsche Mark as the figure
in Danish Kr. so this multiplies the actual price by a factor of 4.5
...and the Germans believe his prices are low!!!!!

we have some 100W RF pagers on 148.100, they are creating very much problems, but I believe most problems is caused by not clean signal from these. Transmitters here are now modified for lower noise spectrum.
>Max output before distortion around +10 dBm
>
>Reasonable noise figure

I have seen 2N5109 used as commercial pre-amplifier on 450MHz systems, this is a TO5 transistor with lower noise figure than the 2N4427 (2N3866)
It is easy to make halfwave tuned notch filters, using Heliax LDF5-50 7/8" coax cable having at least 20-30dB notch on 148.100MHz and very little loss on repeater input frequencies 145.025-145.287

> Any information is appreciated, Thank you,
> -John KC0CKJ
>
A lead-acid battery is not a dry cell. It is very much liquid... Anyhow,
you can build a simple battery without too much work:

Take two pieces of dissimilar metal, I had good luck with copper and zinc,
and place them in a container with a weak acid. One piece of metal will be the
negative pole, and the other will be the posative pole.

I used a short piece of copper tubing and a piece of metal that was
galvanized (coated with zinc). I got a small plastic bottle and put some lemon
juice and water in the bottle. After inserting the two peices of metal, I used
a volt meter to show the charge being produced.

This type of battery will not produce much current, so don't count on
lighting any light bulbs or running any motors.

You could increase the current using a stronger acid, but be careful!
Zinc is very reactive with acids (Especially Hydrocloric acid), so too strong,
and the zinc plate with dissolve.

You might also try hooking more than one cell together to make a larger
voltage.

This is a wet-cell battery. A dry cell has dry components. A normal
alkaline cell (like a AA battery) is made with a carbon post surrounded with an
alkaline (opposite of acidic) powder or paste, and put into a steel can. The
carbon post is one pole, and the steel can is the other.

You might try taking an old duracell apart to see how it's set up. (But
be careful, there's a reason they tell you not to do this on the side of the
battery.) I think they use a nail in the middle, instead of a carbon post, but
I'm not sure what type of metal it is.

I have a paper which talks a little about different kinds of cells. If
you want, e-mail me, and I can scan it and mail it to you, or put it on a web
site.

REPLY...

Okay, now I know what the book is talking about. Between the description above, and the input from Glenn and Gordon, I know exactly what to look for (and where to look for it).

I bet the local hardware store (Surfside Hardware) has some of it, but they must be using another name. But, I think I'll take your suggestion and go to a larger hardware store (it might be easier to find the remaining items).

Thanks again Glenn, Gordon, and you Cecil.

By the way (for those interested), I'm building a vertical antenna to use with FM on 2 meters. It is a two element stacked omni-directional antenna origionally designed by Fred Dietrich (NM6J).

I'm using eight feet of PVC pipe for the structure. The hardware sleeves go under the two wire wraps of the two elements. The top element is connected to the center wire of the coax, and the bottom element to the shield.

It looks easy enough to build, and it certainly should not cost much. I'll let you know how it actually works (I want to hit a repeater that is just out of my range now. Of course, it will also be used with local simplex as well).

REPLY...

After reading Cecil's (W6RCA) message, I now know exactly what we are talking about now. Galvanized steel was probably selected to keep the construction costs down, but it will probably be good enough for this simple, low-power, antenna.

I'll probably end up spraying the entire antenna with an enamel coating (I live by the ocean, so corrosion is a real issue).

Thanks Stephen. I think you're right, from the examples I've found there
don't seem to be any other commands present.

After I posted my message I tried searching again with some different search
engines and managed to find an example file with explanatory comments
(previous searches turned up thousands of CAD services & systems).

M48 = Drill through (no Z value)

Now all I gotta do is build the thing...

Try putting a low voltage (about 1.2 vac) into each winding and
measure the voltage across the other windings. Most transformers of this
nature have secondaries rated for 600-700 v
(plate), 6.3 or 12.6v (filament), and sometimes 5v for a dial lamp. With
1.2 vac into the primary the secondaries should put out 1/100 of the
rated voltage. Also the hv winding should have the most dc resistance.

Bill, if you have a reasonably fast computer (66MHz or higher), you might try the FlexNet software. It runs on a PC with a soundblaster audio card (some other cards are also supported). No additional hardware is required, other than the usual cabling hassle. Oh.. you will need some form of output port for the push-to-talk signal. Serial, parallel, game, or even the MIDI port of the sound blaster card. You will also need a terminal program, although they provide a freeware one by BayCom you can use to start with.

See URL: http://dl0td.afthd.th-darmstadt.de/~flexnet/

It's a piece of cake to get running in DOS mode. It also supports Windows 95 (*not* win 3.1). It's also FREE.

Good luck,

Gary W2CS

>Is there a simple mod for this?

Have you looked inside the supply? All of the Samlex supplies I've seen have a potentiometer on the regulator circuit board. It adjusts the voltage over a small range. You should be able to adjust it up to 13.8 V at least, and 14 V is likely also possible.

698. S and S DVFO-II / other AD9850 DDS designs

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-19 00:00:00 UTC
From: rohrwerk@pconline.com
Message-ID: <69vvnv$kg6$1@bell.pconline.com>
Source record: 87150

The S and S DVFO-II seems to be a pretty good DDS kit, its microprocessor control incorporating several memories for frequency, display offset, etc.

According to them, though, it won't do a transmit offset function, such as shifting the carrier 750 Hz or so on transmit. Ironically, their cheaper one (0-16 MHz only) will do it with the right option package!

Anybody know of another AD9850 (or better!) DDS kit package with somewhat more flexible control? It also might be possible to build S and S's version to get my feet wet, then dig in and put in another programmed processor :-) .

In my opinion it is a very good book (although it says that TBA120S is
good for meteorscatter converter, I believe it is not). The book shows
many very good ideas you will never find elsewhere. But I also like to
have several other books....like RSGB VHF-UHF manual anno 1976, DUBUS
handbooks (the first in the series is best), The dutch VHF/UHF
Handboek, UHF Unterlage and many more

The most important point - but unfortunately often not understood by
the authors - for any handbook is to provide and distribute printed
circuit boards for projects discussed.

A mediocre circuit will almost always be chosen provided a pcb is
available. G4DDK designs ufb circuits and PCBs, but are pcbs readily
available?
I once tried the RSGB multi oscillator "UHF source" (every stage
oscillated), I started to build two units, and they were a complete
disaster - primarily because of nonexisting impedance matching from
each transistors to the tuned circuits.

>
any reason for this?
The handbook proposes to use two independent voltages, one stabilized
low current (1A ?) voltage, I used +12V, and one unstabilized high
current voltage source, 12-15V will do. The application of two sets of
voltages is important such that voltage variations when PA draws
current are not reflected back to the small signal stages and bad
signal may be the result.

That's it! Eureka! Some of the clipped wires bear this out... the two
windings were connected in parallel, including the taps. It is also obvious
now that the line voltage was connected to the first tap up from the bottom.

I'm ready for the smoke test now. Thanks everybody for all the help

There's an easier, better way--unless you want the aesthetic pleasure of watching them bubs burn. Take some copper and form the chimney. Paint it flat black high-temp enamel inside and out. Make sure you've got some air flow between the glass and the "chimney. Since it's a radiation-cooled tube, you're improving the ability of the tube to get rid of heat and actually increasing the dissipation rating of the tube.

Source record: 87212

Try putting a low value resistor (22-100 ohm) across the receiver's antenna connection. This will reduce the breakthrough due to broadcast sigs by a much greater amount than it will reduce the desired signal. This fix will work if it's minor-moderate problem.

If it's worse you should use sharper tuned circuits, a more robust detector, etc. Also be aware that Pin 6 of the NE602 can pick up b/cast sigs if the connection to the local oscillator is long and unshielded. Use a low value capacitor (5-10pF) right near the 602 and use RG174 coax to carry the sig from the local osc. The actual level into the 602 is not real critical (unlike SBL-1s, etc).

>but no difference at all with other brands.

The situation is a little bit different here. Electrically speaking,
the UY1N and the UY11 are the same tube. The UY11 has a 8 pin
Telefunken type socket, as the number suggests. But the UY1N has
an octal socket and not a transcontinental side-contact socket as
the number would suggest.

Visseaux and Neotron were french manufacturers. I ignore if Tungsram
has manufactured in France. I have seen such tubes marked Tungsram,
perhaps I have one or two. The "MG" suffix for Metal-Glass is a
typical french design. I ignore why the cover was blank aluminium
and not black anodized one. This would have some advantages.

>I also have ECH3 and others of the serie branded "miniwatt" which was
>,if my memory is right, a French Philips subsidiary.

During a long time, the tubes of this manufacturer were marked
"Miniwatt Dario", but some others (mainly premium types) were
marked "La Radiotechnique" or simply "RT". Philips has buyed
some old tube manufacturers.

Thanks for all the advice! With your help, I made significant progress in chasing the evil SW broadcast invaders out of my audio output. I think the main avenue for the invasion was pin 6 of the NE602. I shortened the lead and put a blocking cap closer to the chip. That helped a lot.

I also adjusted the level of LO oscillator injection at pin 6. This required me to build an RF probe for my old (now transistorized) Heathkit VTVM. (I made it out of an old probe for a VOM, a piece of scrap circuit board and a length of 1/2 inch PVC pipe. Duct tape provides the external finish and holds the whole thing together mechanically!) The spec sheets for the 602 calls for 200- 300 millivolts RMS input. I set mine at around 200. This also seem to have helped. I managed to work two stations yesterday.
The latest problem involves the VXO. Its a very simple circuit: Colpitts Osc with a toroidal coil and a tuning cap in series with the rock. At one point close to the minimum capacitance setting, there is an annoying pop in the audio. (I've checked and this is not caused by a dirty or mechanically unstable variable cap.) I notice that the oscillator output voltage (measured at pin 6 of the 602) drops by about 50 percent at this point. A quick fix involved putting a fixed mica cap in parallel with the main tuning cap (to reduce the minimum capacitance) but this of course greatly reduced the tuning range of the VXO. Any ideas from all you crystal pullers our there?

Maybe I could check about Tungsram. most of the tubes I have seen were
"importe de Hongrie". Got to find some Crepsin Memento!
BTW, I have to correct one of my assertions :
Neotron did'nt manufcature this kind of MG tubes. I made a mistake
because of a false idea I had of the carton. Neotron specialized itself
in manufacturing American style tubes (42, 78, etc.).
IMA their advertising were a bit frightening , something like "in our
company, each worker is specialized in one or two types of tube. he
makes the same all day long, that is why we can ensure a constant
quality." hem...
I dug in my tubes stock this week-end , and discovered a 6E8MG
"Miniwatt" (so they actually existed) some Tungsram, Visseaux and Mazda.
I compared the aluminium shield. The miniwatt and the Mazda has exactly
the same shape. Tungsram and Visseaux differs.I wonder whether there
might have been some kind of agreement between philips and Mazda. should
I go to remove the shield to check inside...
> perhaps I have one or two. The "MG" suffix for Metal-Glass is a

Those advantage I could see : easyness of machine work (compared to
steel), also to bend the 4 base crimps around the base, final cost
(mostly). I do have any information on the aluminium stock market in the
30's ;-).

My guess is that the phase noise is going to be pretty bad. If you
need to use an op amp, try a part with very low noise like an OP-27 or
similar. As a rule of thumb, the loop bandwidth is usually about 1/10
the reference frequency. This is to give your filter the ability to
reduce reference spurs. The down side is that you may find that very
close in phase noise is not too bad, but the noise outside of your
tracking loop gets pretty high. If you used a DDS for the reference
input, you could raise your reference frequency and help reduce phase
noise quite a bit. Use the DDS for the fine frequency control. And
run the loop at 100KHz or so with a 10KHz BW. This could reduce your
phase noise by nearly 30dB and reference spurs would be way out at +/-
100KHz.

No, you're probably OK, I didn't realize you were just using the amp as
a "passive" follower. It's probably fine, as long as you're *sure* your
overall loop gain has decreased below 1 below a couple kHz. Still, when
monkeying with PLLs, I've always found it helpful to eliminate any
possible source of weirdness. There are enough I can't eliminate! :)

> 2)I don't care about lock time, seconds is fine.
> So if I set the time constant of R1C1 at 300Hz (100 times lower than the
> refernce frequency) Do I even need R2? I currently have just the R1 and
> C1.

Yes, you will definitely need R2 regardless of time constant. You do
not want your loop filter response to still look like the -6 dB/octave
rolloff of an RC filter at the frequency where the loop gain falls
through 1:1, or you will have an oscillator. R2's job is to create a
"knee" in the low-pass response of the loop filter, to set a high
frequency limit below which no further attenuation will occur. (Imagine
C acting more and more like a short circuit as frequency rises... R1 and
R2 start to approach a simple voltage divider at that point. If you
don't have R2 in the circuit at all, your frequency response will still
be falling at -6dB per octave when the overall loop gain passes through
1, which is bad news. With an appropriate R2 in the circuit, the
gain-vs-frequency will have leveled off by the time the gain falls
through 1... unless your op-amp is acting like a low-pass filter as
well.)

That last point was what I was getting at: if the op-amp's frequency
response is poor enough (including its output voltage swing limit at the
frequency in question), it will act just like a low-pass filter
component and cause oscillation. If your total phase shift hits 180
degrees while that gain is still > 1, look out!

>
> Any suggested ballpark values for R1,C1,R2?

Try R1=100K, R2=82 ohms, C1=1 uF, just for grins. This is not really
the right way to design a PLL, of course, but it may get you in the same
city as the ballpark. Winfield Hill's "Art of Electronics" has some
good guidelines, as do the books by Ulrich Rohde and Roland Best
(http://www.amazon.com/exec/obidos/ISBN=0471520195/7294-6027508-231230
should point you to the former; highly recommended).

> The two responses disagree about for R1>R2 or R2>R1.
> I am going to add R2 and try R1 >> R2 about 100 times.

If you don't have R2 in the circuit at all right now, I predict good
results from the above step.

> How good does the filter cap C1 need to be?
> I have some good polyester caps to
> .47uF
> good mylar films to 2uF and good tant's to 47uF.

It's not all that important, you just want reasonably good (but not
necessarily infinite) leakage. The temptation to use a "perfect"
capacitor is always there, but certain other artifacts (see Rohde's PLL
books) are possible if there is no DC loading at all on the output of
the PFD. A good approach is to use a high-quality capacitor and a 1 M
ohm resistor from the output of the PFD to ground. But this is a very
minor point, you'll never see the difference without a spectrum
analyzer.

> detect?
>

The phase detector gain is constant, varying only with supply voltage,
4*pi/something-or-other volts per radian for a PFD (either Rohde's or
Hill's book will tell you). The VCO gain is multiplied (not divided) by
the divider ratio -- a few moments' thought will show why (consider the
effect of n radians of phase error at the reference frequency on the VCO
output frequency). Be careful not to mix radians and hertz when doing
the gain analysis -- leaving out the 2*pi business is a fairly common
pitfall.

Time to sell the expensive scope and buy a cheaper scope and a cheaper spectrum analyzer. :-)

Seriously, we haven't even gotten into the topic of phase noise yet -- you can have what looks like a perfectly stable loop on a scope that has horrible phase noise sidebands. Maybe that's important for your application, maybe it's not. I was looking around a few months ago to borrow someone's analyzer to look at a loop I was designing, fortunately I've since run across a couple of "fixer-upper" analyzers to, well, fix up. :)

Sounds interesting! What's 'LW DGPS'? Where is it broadcast? I happen to have a commercial (Rockwell/Collins) direct conversion receiver with I/Q output capability, might be interesting to try.

I tried building a colinear vertical to replace the "stump" that came with the base unit -- did not seem to help at all. Maybe the radiation pattern is the fault: I have the base unit on a second story window ledge and my walk-around-absolute-distance seems to be 2 (large) city blocks with either the factory "stump" or my 2-element (1/4 wave over 1/2 wave) colinear. It was even worse with 3 and 4 element tests.

I've thought of testing it by propping up the base unit against the (second story) ceiling with the "stump" pointing 'down'. Only problem will be hanging up the hand unit if that is a good solution.... <BG>

I'd be interested in other's experiments, as well.

Almost new (used it once to test car audio at home) Tripp Lite PR-25 13V 25A CD power supply. Newwark price $167. Price $85 + shipping and COD.

Used 48VDC regulated 10A power Sola 28-2233 supply. Newwark lists it $553. Price $275 + shipping and COD.

Also have about 20ea. Condor Value Line type switching DC power supplies. +5V ~@3A, +/-12V @.5A. I will find the exact part number if interested. Since there are so many, I won't be able to check out each of them so as is $20 each plus shipping and COD as before.

Please let me know if you want any of it. My zipcode is 53092 so do a quick UPS calculation for shipping charge and COD to be added to the above price.

Regards, Ki

I'll be using the antenna on 2 meters (so it will be used with faily high frequencies). The book calls for about a 3/8 inch mesh, which I assume is about right.

<SNIP>

I've seen the same thing done using a MC1330 video detector chip. The article used a MC1350 as a wideband rf amplifier followed by a '1330 to demodulate the AM for a two chip AM radio. I believe the author referred to it as a homodyne.

Hey Kemosabie crack open a handbook. A power supply containing a bridge rectifier can be expected to charge up to near the peak AC voltage under no load conditions. That's 1.414 X Vrms.....in this case 1.414 X 3000 = 4242 If Mr Overstreet uses the 3000 volt figure he can expect the 4th of July early this year.

Nice program... alas it induces some simple questions.

I'm setting the loop bandwidth around 1/100th the reference frequency.
What are the pros and cons of increasing/decreasing this value?

I'm using a damping factor of 1.5...
I think I understand the pros and cons here....
Smaller number = more overshoot faster response.
Bigger number = slower response less overshoot
What about steady state phase noise/ oscilation?

Lastly when the program asks for the Phase detector sensitivity
in V/Radians I'm not sure wiether or not to divide by pi etc...
My PLL states the sensitivity is VDD/4pi or 1.25/pi so I've been
entering 0.397... when I do this the program gives me a cryptic error
message about function call failed.
If I use 1.25 it seems to work. Which is correct?

Thanks for the nifty program.

Paul

Missed the original message, didn't we Ian? ;-)

We are not talking about antenna reflectors. The "hardware cloth"
will be used as a component for two phasing sleeves on a vertical 2m
antenna.

And, because of that intended use, wind and snow loading would not be
an issue in this discussion either.

However, your comments will be useful if I ever do plan to build an
antenna reflector, so I will remember what you said.

Thanks for your comments
It is certainly possible that the pager itself is causing the problem due to
(1) Broadband noise from the transmitter
(2) Reciprocal mixing in pager transmitters and IMD products being radiated. The local transmitters are nor required to have isolators of cavities on their outputs and their antennas may only be a few metres apart on thew same tower.

However the local repeaters use the FM828 transceivers which have a front end which can only tolerate about -20dBm which would easily be exceeded in the repeater environment (same tower as the pager)
The notch should help (cavities have also been used) but the pager band is 148-150 MHz.

Hi Bill,

I noticed a similar "blip" with VXO circuits I built for a 7 MHz QRP transmitter and another with 3579 KHz QRP rig. I think it is caused by pulling the crystal just a bit too far. I never did resolve the mystry as I was too eager to get on the air with the little rigs. I haven't noticed any spurs in the output when the oscillator does this and the buffer after the oscillator minimizes the drop in output.

Good luck and keep your soldering iron hot...:-}

Very funny. No, that stuff would not be tough enough. I should probably check with the local automated car wash. Judging from how much damage they can do to a car, the cloth they use should be just perfect.

For reflectors in antennas you can go to surprisingly large mesh or grid spacings, and still get good performance. 1 inch and even larger mesh will work at a wavelength of 2 meters.

If wind and snow loading might be a problem, use the largest possible spacing.

One more application: back in the 1950s, a group of us preteen radio nuts who couldn't afford aluminum chassis (let alone chassis punches) used 1/4-inch hardware cloth as construction material.

You can cut it with sidecutters or tin snips and bend it into shape with wooden blocks, and solder components (e.g., tube sockets, grounded leads of components, etc.). Best of all, it had its own built-in grid for layout purposes. To make a front panel, you can solder a section of galvanized sheet metal to the mesh.

On the downside, galvanized mesh doesn't offer great rigidity, and sometimes return currents would get confused when they arrived at a four-way wire junction, causing feedback<g>.

Still, for casual construction purposes, hardware cloth works better than aluminum foil over masonite (tm) paneling. If surface-mount construction gets boring, give the ol' magic mesh a try.

73,
Brad AA1IP

Hello. I just got an HTX100. I tried to preform the freqency mod but it did not work. I cut the circuit board trace. Then I hooked up 10K resistor between 5v VCC and those 2 pins I cut the trace for.
This did not work. I checked, and only .5v was getting through the resistor to the pins on the CPU. So I hooked up a jumper in place of the resistor to supply the CPU with 5v. Still did not work. What am I doing wrong? Please email direct. Thank you very much.

760. Phasing harness question

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-20 00:00:00 UTC
From: Jan Allbright <jan.allbright.NOSPAM@usa.net>
Message-ID: <34C4D9A2.7A3018EE@usa.net>
Source record: 87170

January QST has a 2-meter phased array antenna made from 2 GP jointed by
phasing harness as shown below..

<A1>-------22"---------<T>--------16"-----------<A2>
where
A1 is the 1st antenna, A2 is the second antenna, T is a co-ax T, third
tap runs to radio.
The array points in the direction of A1

The harness is made from two pieces of co-ax, one 22" and the other 16".

The author / designer states that these antennas are 135 degrees out of
phase.

Someone, please, explain how this can be?

>Overall Height w/bells:5 1/2"
Here are some transformer rules of thumb:

Power ratings can be judged by total weight of the core. The rest of the transformer (shell, copper, etc. is incidental). In other words, when you design a transformer, you start with watts and go directly to pounds of core for a given choice of core material. A Hipersil data sheet would give you numbers, but you would have to know specifically which core material it is.

Transformer power ratings are based on two other criteria - one of which is related to the above core weight issue. Temperature rise and voltage regulation. You can design for a certain voltage drop under full load and you can design for a certain temperature rise due to the ohmic copper heat losses + core heating. For example, if you are willing to tolerate a big fluctuation in voltage under increasing load, then you can design for that. If you're willing to tolerate a core temperature rise of 50 degrees fahrenheit in continuous duty ratings, you can design for that. Not all designers use the same rules for what is reasonable and acceptable. Some designers are ultra conservative and others give you something that are stretching the reliability envelope.

The winding resistances that you gave don't sound consistent. Perhaps I am missing something, but I always divided my copper losses equally between primary and secondary. In the numbers that you provided, if those resistances are accurate, the designer has placed the bulk of the ohmic losses in the secondary. However, you can design for half wave rectification instead of full wave rectification, and it looks as if that's the case here.

But even considering that, the designer has placed almost all of the copper loss in the secondary, which is strange.

My best wild guess is that you will get about 1800 volts at 1 amp peak power out. For continuos duty operation I would think that you might get 800 to 1000 watts DC out. That's the value you could use for your initial load testing.

My advice, assuming you do not run across mfr's specs, is to get a dummy load made up of a bunch of light bulbs in series that are capable of handling the approximate output power level. A bank of about 20 sockets and a drawer full of 100 watt bulbs would work. Then get yourself a variac that's capable of handling about 2 KW. Run the thing up to full voltage input slowly, making measurements as you go, in order to be sure that your load bank is proper for what you're getting out. Once you've seen what you're getting, adjust the load for a 20% drop in voltage from no load to full load and try that for one hour to see how she heats up. If the shell or core gets too hot to touch (anything over 150 degrees) then you are asking too much of it.

If you can't get a Variac (and how many of us can?), you can do the same thing by putting a bunch of light bulbs in parallel with one another and put that bank in series with the primary. By screwing in 100w bulbs, one at a time, you will be raising the input voltage gradually.

Now, if all this is too much for you, then you shouldn't be playing with it in the first place.

Good luck,

Source record: 87172

Re: Phasing Harness Question

Hi,

The two antennas are not being fed 135 degrees out of phase. What I think that the author means is that the sum of their electrical separation in degrees, and the phase difference due to the length of the phasing harness, adds up to 135.

The A1 antenna is delayed from A2 by several degrees because of the extra length in the harness (I make it about 40 using a velocity factor for the coax of 0.66 at 145MHz) so that when the wave arrives from A2 this delay would be subtracted from that due to the physical spacing alone.

I do not have a copy of the January issue of QST but if the spacing is around 1/2 wavelength, then this would appear to be about correct.

Source record: 87174

My educated guess is, at a weight of 24 pounds you can't expect to get more
than 300 ma. continous and 500 ma. peak.

With a bridge supply you could get 3000 volts DC at the above ratings. Good
enough for a pair of 3-500Z's.

With a full wave rectifier, you could get 1600-1800 volts, good enough for
2,3 or 4, 572B's.

The post, that I just grabbed off dejanews, is below. I'm sure you'll
hear from him yourself, since he is a regular.

He mentions a specific IC, but I've seen the thing done with other FM
detector ICs. The important point is that the actual FM detector be a
balanced demodulator; some are, some aren't. For FM use, the built in
limiter feeds one input of the balanced demodulator, and a phase shifted
version feeds the other input. When using it as an Am detector, your
incoming signal feeds the limiter and the other input to the demodulator;
the limited signal acts like a constant reinserted carrier, and mixes
the incoming signal down to audio, just like in a product detector.

It is a neat trick using an FM detector IC. The same idea has been seen
in other articles, but using separate IC's. The QST article mentioned
below does it, using an NE602 as the balanced demodulator. Years ago,
you'd see the same thing done with an MC1496 as the balanced demodulator.

I designed a circuit 10 years ago using TI SN76660N/TBA120
(=Telefunken SO41P) FM quadrature demodulator. max 25mV IF signal was
fed either to limiter input and quadrature detector input, It has much
better quality for AM - in particular during fading, and you could
read signals when they seem to fade down into the noise using standard
envelope detector. SM6HYG Carl-Gustaf copied my circuit and found it
very useful for mediumwave dx'ing

do you mean the 6-hole low-Q wideband chokes, like Philips/Valvo
VK200? (I use them as PA base chokes and powersupply lines)
You also easily find surplus ferrite beads (often used on valve heater
lines), but too often they have u=3000 and as such not good for VHF
baluns/amplifiers

> Has somebody ever made a conversion or equivalent list?
Tom, LB8X mentioned these details:

Philips Amidon
Type Permeability Type Perm.
4C65 125 61 125
4A11 700 43 850
3F3 1800 77 1800
73 2500
3E25 6000 75 5000

769. Here is how to determine CURRENT RATING of old PWR XFMR

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-20 00:00:00 UTC
From: mcalhoun@ksu.edu
Message-ID: <6a3110$5h2@abc.ksu.ksu.edu>
Source record: 87179

n2ey@aol.com (N2EY) writes:
>Here's what I do to identify old power iron,
>First, take ohmmeter readings of ALL the windings and.... [snip]

To determine the CURRENT RATING and OPERATING CHARACTERISTICS, see
the article "Rating Unknown Power Transformers" by H. Q. DUGUID on
pages 24-25 of the July, 1964, issue of ELECTRONICS WORLD.
That article includes two useful graphs:

Unit resistance of high-voltage winding vs. permissible current
Primary current plotted for various primary resistances

"To determine the maximum current that can be drawn from the high-
voltage secondary as d.c. current from the filter, it is necessary
to calculate the unit resistance of the high-voltage winding. Divide
the measured d.c. resistance in ohms by the open-circuit or no-load
a.c. voltage to get ohms/volts. .... Read on the curves of [the
first graph] the permissible d.c. current (in ma.) that can be drawn
from the filter for either choke or capacitor input filter.
[snip]
"The curves given in this article are for for standard radio and TV type
transformers--not hermetically sealed but equipped with standard end
shells. Transformers with special heat radiating fins inserted into
the core are capable of somewhat higher loads--the increased surface
makes it possible to dissipate more heat. Standard-type transformers
will run hot at full-load as the copper losses as well as the iron
losses must be dissipated. The method detailed in this article may be
extended to hermetically sealed transformers but this will require
collection of data to prepare additional curves. Generally speaking,
ratings for hermetically sealed units will be lower because of the
increased difficulty in dissipating the heat."

Something like this is shown in "Amateur Radio Techniques" published by
the RSGB. It's in the sixth edition that I have. It uses a CA3028 for an
RF amp, but now that you mention it, the MC1350P/MC1330 combination sounds
familiar.

The MC1330 (and I once found an equivalent in a junked tv set) is meant
for this; in the Motorola databook it's labelled a "low-level video
detector". Interestingly, the circuit configuration is not such that it
can be used as a double balanced mixer for other purposes.

I'm not sure this device has seen as much use as it might be. Besides a
video detector, the only places I've seen it used in hobby publications is
in the receiver I mention above, and once in QST in a transverter to put a
49MHz walkie talkie on 220MHz, as a carrier detector.

I am trying to design a regulator for 12 VDC that will handle about 40 amps. I don't have the experience to create a good, efficient, regulator. Please point me in the right direction.

I need to regulate the voltage from my deep cycle battery bank. When I charge them, I must use voltages as high as 14.5 vdc. I have devices that need 13 vdc or less. I have found some ICs that will regulate 2 amps. Do I need to use 20 of these in parallel? (There must be a better way.)

Thanks,

cptn@olywa.net

There is: mailorder@cirkit.co.uk

Another source of Micrometals cores in the UK is Bonex (tel: +44 (0) 1753 549502). Bonex stocks a larger range than Cirkit, as well as Fair-Rite ferrite cores (Cirkit stocks them as well). Prices are about the same. Both of them sell a wide range of Toko inductors.

777. reverse TNC jacks

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-21 00:00:00 UTC
From: Stefan Huelbrock <huelbroc@rapc20.informatik.uni-tuebingen.de>
Message-ID: <syvg1mi6l8p.fsf@rapc20.informatik.uni-tuebingen.de>
Source record: 87100

Hello,
first remark: please reply via eMail, I've not subscribed this
newsgroup.

I have the problem that we need a pair of weird TNC-Connectors
for a radio ethernet.
The antenna of the device is mounted with a TNC-plug direct to
the device.
We want to put some cable in between... so we need a cable
with a female TNC-plug at one side and a male TNC-plug at the
other... no problem...
...but:
A normal male TNC-plug has a nut to fix the connection mechanically.
But in the case of our radio-ethenet the nut is on the female side.

Can I take normal TNC-plugs/connectors and exchange the inner part
(the white plastic and the golden connector) between the housings?
With plugs for crimping this seems impossible.

Or are this real plugs which have a name and which I can order
somewhere? (Best in germany :-) but if you don't know, US-
Adresses are welcome too.)

Thanks in advance
Stefan.

Message-ID: <VA.00000035.0017e865@gto.gto.net.om>
Source record: 87101

Thanks for the info.

Hi Chris,

I haven't got my January issue of QST (it comes sea mail), so I cannot make out what the antenna is supposed to do. The difference in the phasing harness lengths is about 45 degrees (lagging at A1). With a spacing of 1/4 wavelength, that would make it into a low gain end-fire array. If the phase difference were indeed 135 degrees, then the gain would go up to about 4dB which is quite useful but I cannot see that it is.

The books (Kraus and ARRL) give the patterns for vertical half-waves but as I see it this should hold for two GP's since they are identical and the waves will sum in the same way.

Well, yes, indeed, I did miss the original. However, the subject title did bring to mind a problem I have. I have a fiberglass camper on my pickup. It has a thick roof layer (about 2" of fiberglass and foam) and I was wondering if placing a piece of hardware cloth or any other suggestions of material to the inside of the cap would give me a ground plane for any antenna I place on the cap?

Any suggestions on materials or how to attach them would be appreciated.

Greetings,
I'm looking for a source to find: MC3335P 20 pin ic receiver chip made by Motorola. The chip is no longer in production and all of the parts houses do not have the chip as stocks have become depleted.

This is the main receiver chip used by Ramsey Electronics in their FX series FM amateur radio kits.

Please let me know if you have a source for this chip.
Sincerely,
Mike Igo

Amidon is indeed a stocking distributor for all of the other manufacturers parts. Amidon now manufactures amny of their own cores and mixes directly, therefore many of the prices have dropped significantly.

We will be posting a map listing the locations of all our world wide distributors. This will include a rather large list of distributors in Europe.

I hope this assists in your pricing dilemma.

Tim --

A lot of us do just that. I don't like adding a capacitor if the
original circuit doesn't call for one, tho. Generally you can wind
your toroid to get close to your inductance, then compress or expand
the windings to get the inductance closer to the target.

The other solution is to get a slug tuned coil that you have spec's
available for. (Insert shameless plug here) Amidon has sheilded
slug-tuned inductors that you can wind to your specifications.

You can find information about them at
http://www.bytemark.com/amidon/l33cf.htm ,
http://www.bytemark.com/amidon/l43cf.htm , and
http://www.bytemark.com/amidon/l57cf.htm

I hope this is of assistance!

Ordinarily, you want to aim for a damping factor of about 0.7.

I believe it. I've asked for hardware cloth and been told that they don't have any. When I asked for screen the kid told me where it was. They did have hardware cloth after all and I had to explain to him what it is called.

I've had employees in lumber yards who didn't know what five-quarter wood is too. But when I asked for inch-and-a-quarter, they said that they did have that.

793. AM Detector -- FM Chip (J-M Noeding??)

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-21 00:00:00 UTC
From: jim@rst-engr.com
Message-ID: <34c71e8c.1483171@news.gv.net>
Source record: 87116

Thank you all for the suggestions on how to achieve this, but as yet I don't have a real straight answer to "how", and I'm hoping Jan-Martin Noeding reads this and can give a good email address that doesn't bounce.

Anyway, to those of you that suggested using the RSSI output, it isn't quite linear enough over changes in input signal strength. That is, for a given percentage of modulation, the audio level varies quite a bit over the 90 dB range of the RSSI output port.

To those of you who suggested using an external AGC amplifier feeding the balanced detector and the internal limiter feeding the other side of the balanced detector, that is the essence of the synchronous demodulator found in a lot of the TV video amplifier and demod chips and I have done some design with these devices. They, too have their own set of difficulties.

It seemed that Jan-Martin, in his earlier post, used nothing but the FM IF chip itself and I was wanting a little more information about that technique.

la8ak@xnd.k.nor (J M Noeding)
shared these priceless pearls of wisdom:

->a quality demodulator using MC1330 was shown in wireless world (and TT
->Radcom?), but I never succeeded using this circuit. Later a multimode
->detector (AM/FM/SSB) using MC1351 was shown in Radcom. I used
->TBA120/SN76660N in a similar circuit for voltage switched function
->AM/SSB demodulator (without FM facility)

The problem with the MC1330 was that 12 volts was the absolute minimum voltage that would make the thing work, and it was much happier at 15 volts. Using it at 12 volts would sometimes work and sometimes not as a function of temperature, "12" volts being very slightly low, frequency, and a whole bunch of things...

JM, I've been trying to send you email asking about your one-chip AM receiver design and I've gotten mail bounced back three times. WOuld you check your return address or send me an email with the correct address?

TheNET X1J4 will not work in a KAM. It will only work in a TNC2
compatible TNC using a Z80 processor and SIO. The only exception was a
version developed for the AEA PK96 but that version is reported to have
a serious bug.

There is a firmware version of G8BPQ that is compatible with X1J that
will work in a KPC3 or KPC-9612 but not that I know off for the KAM. It
is called K-NET and is available only from Kantronics or their dealers.
To ask someone to copy it is to ask them to commit an illegal act ie
making a copy of a copyright protected product without authorization.

As for the TheNET X1J4 code, you can ftp download a copy from the NEDA
web page at

http://www.cam.org/~burt/neda/neda.html

or specifically

ftp.cam.org/users/burt/nedax1j4.zip

797. Help Simple VCO/PLL Problems....

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-21 00:00:00 UTC
From: Chuck KD9JQ <kd9jq@imaxx.net>
Message-ID: <34c672c6.0@news.imaxx.net>
Source record: 87120

Paul,

Typically for 2nd Order loop you want to use .707 for the damping factor
for the response. The documentation, references, and online help hints
should guide you in your design as to why. You can do a test design
using "F1" to enter default values to see a typical design.
I try and provide useful hints.

A loop BW of 1/100 of the reference is also a good starting point.
Less means lower reference rejection, higher means higher rejection.

.397 Phase Det Constant sounds good.
Using it with 1.5 damping may cause problems, again start with .707.

Also try the 3rd order. It's not that hard to work up a good design
using the hints I provide.

The program doesn't actually "model" but is a visual aid using typical
design equations which provides fast info to you.

798. Question: Anderson Power Pole connector contact (+12V-Gnd) order

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-21 00:00:00 UTC
From: Brian Kline <kline@no1spam.hybrid.com>
Message-ID: <34C6ED93.8E0@no1spam.hybrid.com>
Source record: 87121

Can some one tell me what the standard order for positive and ground contact with Anderson Power Pole connectors is. I am building a DC distribution panel similar to the MFJ-1118 unit using Anderson power pole connectors. I would like to adhere to any standard that exists. In the past this has not been an issue because the connectors were on cables where it was easy to change the order of the red and black contacts. In the distribution panel this will be much more difficult to change later so I would like to get the maximum computability the first time. Does the MFJ-1118 conform to the generally accepted standard.

Now the problem is to describe the order of the contacts.

Looking toward the front of the connector with the contact surface facing up. Is the red (+12V) contact on the right or the left of the black (ground) contact.

The order is the same for both the source and load connectors when viewed this way.

Any help with this detail is appreciated.

There's another way, too. If the FM if chip has a RSSI (logrithmic S
meter) output from the limiter, you can get AM signals by feeding that
into an antilog amplifier. (Never heard it, just a neat hack from
a posting here).

800. neutralization of tetrode

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-21 00:00:00 UTC
From: Kwak Jong-Gu <jongkwak@nanum.kaeri.re.kr>
Message-ID: <34C56AFE.B1FACC91@nanum.kaeri.re.kr>
Source record: 87123

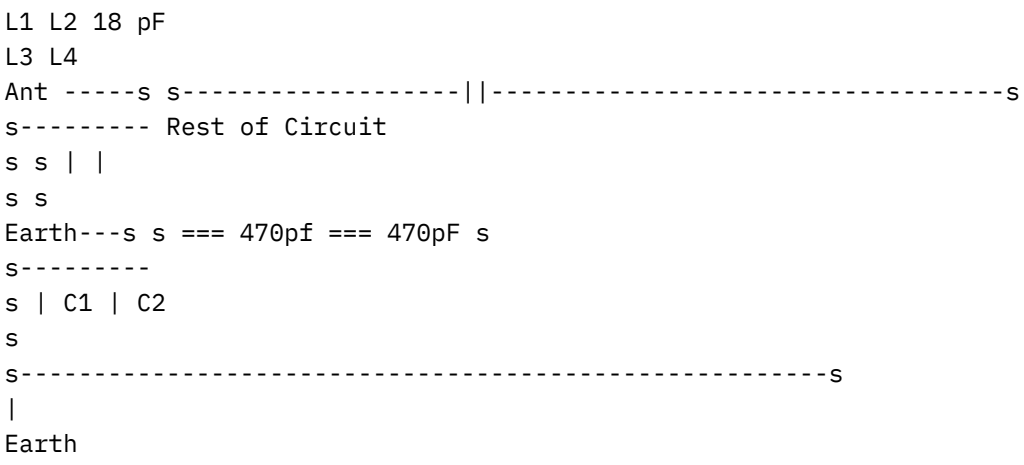
hi
I make the 100 kW rf transmitter frequency of 30 MHz.
I succeeded in the neutralization of tetrode 5 months ago, however, I
can't find the neutralization condition now though almost every
conditions are the same as before...
What reason and wher is the problem????

I thought two possibility of the problem
First, The weather condition can change the tube condition such as the
input/output capacitance of the tetrode, so the tuning is not good now
because the temperature is very big different at the time of between
tuning success and present. (When the tuning was succeed, the
temperature was about 28ï¿½ï¿½due to summer, however, it is 13ï¿½ï¿½ because
the warming system is not good at the rf room and it is winter now)
Is it necessary to tune the neutralization of the tube on the condition
that the filament
is turn on(black heating)?

Second,
I measured the input/output capacitance of tetrode(Thomson's TH581)
using network analyzer under the condtion that the tube is installed at
the socket(TH16130).
input capacitance(control/screen) : 690 pF
output capacitance(anode/screen) : 78 pF
these values show a little(??) difference from the data of
Thomson.(According to Thomson, they were 500pF/48pF respectively)

I think that these make a bad effect on the neutralization because
Is there any problem at the tetrode?
Is it necessary for me to do H.V test of the tetrode?

I am looking forward to your reply.....



801. Help for a begiinner, impedence

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-22 00:00:00 UTC
From: Kelvin Charlson <kelvin@netspace.net.au>
Message-ID: <6a78sancs1@otis.netspace.net.au>
Source record: 87030

Hi I am trying to modify a circuit I have built, currently it is designed to operate at 80 meters, I want to modify it to work at 10 meters,so I have to change the filters, and need to calculate the impedance's so I can match them.

My circuit consists of

antenna ->3.5-3.7 Band Pass filter -> then on to rest off circuit.

L2 and L3 have an inductance of 2.165 uH
they are made from 0.2mm, 26 turns, on a 5mm ferrite tunable slug, mue (u) for the slug is 12 incase you need to know.

L1 is 3 turns of 0.2mm,wound over L2

My question is how do you calculate the impedence of the tuned circuit (L2, C1)

I know the impedence from the antenna will be 50 Ohm, and the formula for the transformer match is

Zp/Zs = (Np/Ns)^2

but as you can see I need to know Zs, the impedence of the secondary winding

If you help I would be greatly appreciated

Kelvin Charlson VK3HKC

The 1977 ARRL handbook has a section on rewinding xfmrs, and shows
a chart of power based on the cross-sectional area of the part of the core
that goes thru the winding.

Your library might have oa copy, or maybe a friend, if you don't.

good luck

Date: 1998-01-22 00:00:00 UTC
From: la8ak@xnd.k.nor
Message-ID: <34c7b84c.778122@news.online.no>
Source record: 87036

My email address is shown in the signature.
I don't know if I have missed some posts, but Signetics shows am synchronous detector application for NE604/614.....
I have no idea what the sensitivity might be, but it was in the region of 10-25mV RMS maximum for SN76660N and MC1351P....., and we even used the MC1357P as 70MHz FM demodulator, the older types often run on higher frequencies than the modern types. The reason is that they uses fewer long-tailed pairs with fewer transistors and they are not particularly designed for micropower operation. TBA120/SN76660N will operate up to 20...30MHz, and I think MC1351P also goes similar. A perhaps more interesting circuit is use of NE565N or similar PLL device with MC1496 (or other) as phaselocked synchr. AM demodulator?
LA6MQ made many experiments using MC1310P (stereo decoder) as audio oscillator/mixer (low frequency carrier frequency systems for multi channels for 10GHz gunnplexer fm).

NE/SA604/NE614 (as quadrature AM demodulator)
Fig. 7 in the Signetics handbook shows how you can use NE614 as synchr demodulator.
My suggested circuit - not tested (see TYPICAL FM APPLICATIONs) with the following exceptions:
No connection to pin 9. Pse use EDIT to see the circuit diagram below.

Anybody have a source for RF relays that come in a hermetically sealed metal can, SPDT, that will work at 450 MHz up to about 150 watts? I am specifically looking for ones like used in the GE MASTR II radios...the relay is about the size of a 14 pin DIP I.C. but about 3/8 inches tall.

Can a transformer from a microwave oven be used for a plate transformer? It is rated at 4000V @ 300Ma with the doubler circuit for 850 watts output. Without the doubler would I get 2000V @ 600Ma ? I would like to build a 6 meter amp using a single 4CX800A. Any help on this would be great!

I built this and had good experiences with it. My main problem was not being able to tell what frequency it was tuned to and the non-linearity in the tuning of the tuner. However, these are problems that can be and have been overcome by others.

If you are going to build this, I recommend getting the book along with it. Lots of good examples and ideas from other builders.

Joseph

REPLY...

Well, why didn't you say that (or did you ;-)? In general, the answer to your question is, yes. Placing metal inside the roof, and attaching that metal to the metal body of your vehicle with a jumper wire, would give you a ground for a mobile antenna.

This metal could be hardware cloth, aluminum foil (glued on), a sprayed-on metal surface (real metal, not simulated metal), or any other metal that can be attached with a jumper wire to the metal body of your vehicle.

Another possibility is to place a large sheet of metal (aluminum sheet) on your roof, and grounding that to your vehicle's metal body. Even a large metal roof rack can ocassionally provide a basic ground, if it is grounded properly (a jumper wire to the vehicle's metal body).

Of course, the shield side of the antenna should be attached to the metal surface you apply (just like it would if placed on a metal roof of a vehicle).

A magnetic antenna will not likely work with any metal placed inside the camper roof. First, you would probably not be able to get enough metal up there for the magnet to stick to. Second, you will not likely be able to get a decent ground. Magnetic antennas are usually designed to work only through a thin layer of paint, not through thick fiberglass.

Of course, all this is theory. I have not actually tried this personally (but I have seen it done), but there is no reason it should not work just fine.

Can anyone help me out? I just got a used VX-1R and I am having a few problems. First the Priority Channel does not seem to work right. If I am in the Ham VHF Band and it is receiving it will not go and check the priority channel (in the ham uhf band). Do I have something set wrong? I also wanted to know If I could do a cross-band split. I just found out that there are differnt versions. I heard someone sent theirs to upgrade the CPU. Can this be done? Is here any reason to do so? Will the adams software do anything for me? This unit must have been moded. It RX's the cell band and TX's all over the place. I think it is the A102 model. Can the mods be done on the newer versions?

Can anyone help???

From: aci6@aol.com
Message-ID: <19980122054700.AAA11449@ladder01.news.aol.com>
Source record: 87127

Hello Jim,

You could do the following, but, please do it carefully!!

Using only half the secondary (1500v), put a large value resistance across it and look at the change between open circuit voltage and the voltage under load. Decrease the resistance value and repeat the process. For instance:

At 15,000 ohms, if the voltage was 1500v, then the current would be 100 mils. And, at 7,500 ohms the current would be 200 mils, etc.

I have done this in the past using several (2 to 5) high power resistors to achieve the desired load. At 200 mills and 1500v you would be dissipating 300 watts, so, even for a few seconds, I would think you would want to use a resistor rated at 50 watts or more. And at lower resistances the power rating should be increased to a reasonable level. Bear in mind that you should only apply voltage for a few seconds at a time if you are dissipating more than the rated value of the resistor(s).

Once you have determined the voltage at various loads, you can make a judgement as to the power capability of the transformer. At 200 mils, if the voltage held at 1500v, then the transformer would be capable of delivering (at least) 300 watts x 2 or 600 watts. Of course, I would think that it might be capable of more since it is rated at 3000vct.

I am sure that there is a way to estimate the power capability of this transformer using the data that you provided, but I kinda like to see it for myself!!

And, one other thought. You could string a dozen or so light bulbs across half the secondary . . .

Regards,

Bill

You don't really need a huge UPS to run all that, just a huge stack of batteries -- and perhaps the ability to isolate part of the batteries to charge them off your truck. The easiest way is to run everything off 120VAC from an inverter.

You'd want to determine the total load of all your stuff, and then size your UPS somewhat larger than that. (The voice of experience -- if you have a laser printer to put on the UPS, the UPS MUST be able to carry the full stated load of the printer, typically 10 amps.)

You are not necessarily bound to use a 12-volt (nominal) system. Telco uses a 48-volt battery stack, and you might find some surplus at that voltage, including batteries.

It's possible to get DC-to-DC converters at ridiculously high efficiency levels (I've seen 97% efficiency claimed lately) but these new devices are expensive. Surplus/junk is cheap. And that makes me happy.

FWIW, I have a cheap, smallish UPS that I plan to rework to allow adding as many deep-cycle marine batteries as I want, so that the next time the electricity goes off, I can watch videos all night long.

we are in the process of building both a mobile and base type
homebrew amplifiers, these amps use the 2SC2879 transistor and the
base amp has it's own power supply. these are homebrew and are not
for use on the 11mtr band. you must present a fcc license to inquire.

Microwave transformers have a primary for the local power
voltage and a secondary that may be anywhere from 1.5 to
2 kV. Power rating is 'adequate' to quote the Rolls Royce
ads.

Just look for and remove the 'magnetic shunts'. These are
two bundles of laminations jammed between the windings.
A pin punch will get them started out.

Finally be aware that the high volts in a microwave are
rectified against ground! The winding is soldered to a
lug on the frame. If you want to use it with a bridge you
will have to satisfy yourself that you can adequately
insulate the secondary (several kV) from the frame. The
manufacturers take almost no precautions at all.

Great meter, I think it's also in a couple of the ARRL handbooks. I
happen to have a couple of the 50 uA full scale meters if you need
one.

Email me if you can't find a copy of the book.

I happen to have about 8 latching relays that meet the spec's that you
mentioned. These are in a metal package about the same size as a
Mini-Circuits SRA-1.

I had a bunch of the relays out of mastr-ii 800 MHz units, but they're
long gone. I found that these have a lot better isolation anyway, and
since they're latching it doesn't require a constant voltage to keep
the relay in a constant state. great for battery stuff ...

THere's a place that has (or had a few weeks back) cases of these
things, so they're plentiful as well.

Re: Microwave oven transformers.

Hi,

See the article by Randy Henderson, WI5W in Jan/Feb '98 issue of the ARRL magazine 'QEX'.

You could also try re-posting your request to sci.electronics.repair where you may catch the eye of Sam Goldwasser who knows about such things.

etc...

Unfortunately, a magazine from 34 years ago may not be very accessible to
folk now. But the part mentioned by Myron does offer a clue. You can actually
get a very good idea of winding temperature by measuring the winding
resistance when it's cold, then running it under a safe load for long enough
for it to reach thermal equillibrium. Remove power and load, and quickly
re-measure the resistance. The thermal coefficient of resistance for copper
will let you calc the temperature rise. You need to make an educated guess
about the thermal rating of the wire insulation for this to tell you very much,
but if you have a known transformer of similar construction and vintage
(not necessarily the same physical size), you can make a similar measurement
on it and find how it does.

>Core Dimensions:71/4" L x 5 1/4" W x 2 3/8" thick

My WAG is that it should be good for about 600VA CCS. I do agree with another posting suggesting that the resistances look funny, but to me they look funny the other way. If you put 5 amps thru 1.8 ohms, you'd have 45 watts power dissipation, and that's a LOT in that size transformer! I'd suggest you re-check the primary resistance by putting something like 100mA DC thru it and measuring the voltage drop. Be careful when you disconnect the 100mA!!! (Short the secondary.) I have a transformer just slightly heavier (29 lbs) and the primary is about 0.22 ohms

> great!
> 73 N8WDN
so you are saying that the transformer is rated at 2000volts at 300ma
or is it rated at 2000volts at 600ma? any way a doubler will only
increase voltage there is no way of increasing amps. which is set by the
size of the wire and the iron of the transformer. a microwave oven power
transformer most likely doesn't have a center tapped secondary. thus
the only rectifier to use would be a full wave bridge. no way will you
get 600ma out of a 300ma transformer.

Microsoft dictation is a research demonstration program that you can download to learn how to
effectively use speech recognition. The program can use a variety of different microphones and
after a brief training session of learning the user's voice, it can be used as a dictating
machine. It features over 60,000 word vocabulary, dictation into any application, included
dictation pad, and the ability to automatically convert spoken numbers. It also supports multiple
users that can train their voices as well. This program is for advanced users as there are many
scientists researching these areas, evident from this web site. The program is a whopping 11MB
download and requires Windows 95 or NT, a Pentium90+, 16MB of RAM, sixteen bit sound card and a
quality microphone. Except for the included URL, this entire note you are reading now was
completely generated from my speech, including the punctuation marks. I did not have to re-type
or correct for errors. Have fun!

841. Help with impedence problem

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-23 00:00:00 UTC
From: Kelvin Charlson <kelvin@netspace.net.au>
Message-ID: <6a9p6j$k95$1@otis.netspace.net.au>
Source record: 87060

Sorry about the other posting, I didn't expect it to get screwed up like that, hopefully this one is better

I am trying to modify a circuit I have built, currently it is designed to operate at 80 meters, I want to modify it to work at 10 meters,so I have to change the filters, and need to calculate the impedance's so I can match them.
My circuit consists of

antenna ->3.5-3.7 Band Pass filter -> then on to rest off circuit.

L1 L2 18 pF L3
L4
Ant -----s s-------------------||---------------------------------s
s--------- Rest of Circuit
s s | |
s s
Earth---s s === 470pf === 470pF s
s--------- Rest of Circuit
s | C1 | C2
s
s---s
|
Earth

L2 and L3 have an inductance of 2.165 uH
they are made from 0.2mm, 26 turns, on a 5mm ferrite tunable slug, mue (u) for the slug is 12 incase you need to know.
L1 is 3 turns of 0.2mm,wound over L2
My question is how do you calculate the impedence of the tuned circuit (L2, C1)
I know the impedence from the antenna will be 50 Ohm, and the formula for the transformer match is
Zp/Zs = (Np/Ns)^2
but as you can see I need to know Zs, the impedence of the secondary winding
If you help I would be greatly appreciated

One Solution could be to use two transformers, connected in series,
but with different phases. This will give the same voltage between the
hot (and insulated) terminals, and the setup can deliver twice the
current, and power.

With a 32 kHz ref freq, the time constants needed will be fairly long, leading to high values of R's to keep the value of C within reasonable bounds. The LM324 has quite large input bias current that will cause plenty of offset and might even prevent lock.

I'd suggest an op-amp with a FET type input. LF356, TL071 and their relatives work well.

I put a lot on PLL stability and loop design in the latter half of chapter 14 in the ARRL handbook (1995 onwards), poles & zeros and bode plots etc with pocket calculator maths.

Cheers

Seems a reasonable idea (using FET-input op-amp) but do beware of
implications if you use over a wide termperature range as FET-input
amps bias current doubles every 10 degrees Centigrade -though
this is starting from a relatively low value of Ib compared with
bipolar input devices.

I think your specifications are rather limited.
Which purpose do you intend to use the relay for?
If it is packet radio, the only reliable component is the PIN diode.
Do you want to switch 150W RF or shall this amount pass only when the
relay is already operated?
Do you intend to use it with sort of RF VOX ?

I don't see any reason why not, it would appear they are selling the 'plans' to build such a reciever, unfortunatly they make no mention of cost which I would guess is at least a $500+ to build a continuous coverage RX from scratch with this capability.

Tim

849. "Universal" emergency power system? Ideas, anybody?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-23 00:00:00 UTC
From: apavlin@nasa.kodak.com
Message-ID: <6aan51$i0c$1@kodak.rdcs.Kodak.COM>
Source record: 87068

Greetings, all.

I'm looking for a circuit for a "universal" backup power system for my shack. Not only do I want to be able to run mobile and portable radios (usual +12VDC) off this contraption, but also I want to run my ISDN terminal adapter (+5VDC@2.0A, -30VDC@0.3A), a laptop computer (+19VDC@1.2A), TNC (+12VDC@0.5A), and a Peet Bros weather station (+9VDC@0.3A) as well, so everything I would need for emergency communications and operations would still be alive.

Note that the ISDN terminal adapter needs to be powered because digital phone lines don't provide the power for the customer-premise equipment, unlike analog phone lines, so if the commercial power goes out, I don't have a phone (even though the phone lines are still live).

As for recharge sources for the bank of lead-acid marine batteries, I was looking at a always-on AC charger (rigged to not over-charge the batteries), solar panels, a long cable to the driveway (to tap off the truck's electrical system while the engine is running), and cat hair static (just kidding on the last one! :-).

In short, I want to build an always-on-line UPS with extremely long run time (not just an hour or so) without the inefficiencies of converting back to 120VAC and then converting again to the various low DC voltages required for the assorted pieces of equipment. Having built-in protection from power restoration surges for the powered equipment would be a serious plus. Having the controller cut off "less necessary" loads as the battery charge level dropped would be a plus, too.

Any ideas, folks? Or should I just get a really big UPS and plug everything into its AC outlets? All the "odd" DC voltages out, plus the current demands implying a large recharge capacity (hence the desire for efficiency to avoid wasting valuable battery power on inverter losses), is what is making the idea seem rather complex.

I don't know what happened to my slide rule on my calculations of ohmic losses. The ohmic losses are more in the primary than in the secondary. However, as is more likely the case, the primary resistance measurement was in error and the ohmic losses are probably pretty well balanced. Never use an ohmmeter to measure low resistances You really have to do it with a healthy source of current and a voltmeter. Sorry about the mistake.

Thanks to K7ITM for point out the discrepancy.

You can only build one RF power amplifier capable of operation below 144 MHz in a calendar year for amateur radio operation without a grant of type acceptance.

Ref: 97.315 Type acceptance of external RF power amplifers

If you want really "long" backup power, use a standard UPS (however many VA you need to run for 20 mins or so..) and then hook up a generator... The # of batteries required to run for a long time would be a bit much... A reasonably inexpensive portable generator would do the trick for not too much $... you just need to put a crossover switch on the AC supply to the equipment you want to run off the generator. I'd recommend putting in a sub-feed off your main AC feed.

Just my $0.02 worth...

Do you need a really big UPS, or just several small ones? Your non-rig loads are very light, so an average UPS would run that stuff for a while, and isolating each higher current demand rig to a UPS would help also - I am told that UPS units can generate some RF noise, so you may want to check that out. Please share your solution, I'd love to know! 73, DavidC AA1FA

>rather complex.

Hello!

From the power requirements mentioned, the heaviest loads are all 12 VDC, so I'd go with a 12 volt bank of batteries, with various charging systems. To power the other gear, build separate DC-DC converters for each piece of gear. They can probably be unregulated. Each can be turned off when not needed, to save power.

To charge the batteries, a voltage regulated charger is needed. When the power fails, a 12 VDC generator can be used, as well as the other options you mention. There was an article in QST early last year about building a 12 VDC battery-charging generator from an auto alternator, a lawn mower engine, and some bits and pieces. Cost less than any commercial generator because it used a cheap vertical shaft lawnmower engine.

Solar power is great, but the short hours of sunlight in Rochester during the winter make it difficult to keep the batteries charged. (I used to live about 20 miles east, in Palmyra. Brought this N2 call back to EPA with me.) During the summer, though, you'd have plenty of power, if your panels are big enough.

Hope this helps.

868. Bypass caps and ground?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-24 00:00:00 UTC
From: wmeara@erols.com
Message-ID: <34ca2967.89313652@news.erols.com>
Source record: 86991

When engineers design RF circuits, do they have to take into consideration the kind of "ground" that the device will be attached to? There seems to be a wide range of grounds - in some cases the device is really not connected to the earth and the only ground is the chassis ground. Next I suppose you'd have the chassis of an automobile as ground. At the far end of the spectrum you'd have a for-real earth ground (say a big hunk of metal buried deep in the earth and connected by a thick copper cable!) Do designers build circuits differently for these different circumstances?

I'm thinking specifically about RF bypass capacitors. Wouldn't these devices work better with "better" grounds? I remember the little experiment that they do in high school physics labs where the electroscope can transfer more charge to a metal plate if another metal plate is parallel to it ... and it can deliver even more charge if this second plate is connected to the earth.

I have an old tube type shortwave receiver (Hammarlund HQ-100). It squeals like a banshee if it is not connected to the earth. Is this squealing related to the little physics experiment described above?

Thanks in advance Bill (N2CQR)

OK, I took the bait and went to this commercial KURZWEIL web site. I don't typically waste my time on cripple/time-limit/demo/nagging software. Also, I don't fill out long pre-registration forms like this site has. The KURZWEIL VOICEPAD EVALUATION VERSION may be a good product, but being nearly 6MEG in size and requiring 20MEG of disk space for a limited 11000 word vocabulary that will only allow 2500 dictated words for the evaluation period before it turns DEAF does not make it worth my effort to download it.

I have a KURZWEIL product that came on CD-ROM that was included with my Sound Blaster card. I was told by a several other users that it wasn't worth the install. So I didn't bother with that KURZWEIL software. In fairness, it may not be the same product, but they don't offer much more software then this.

Perhaps you can site specific problems of the M$ product, or enhancements of the VOICEPAD product. How about SPEAKING your next note, like the posting I made, without manually correcting for any errors or mistakes. I'd like to see that program's output when put to the test, and I am sure others would be interested. Ken, please post your KURZWEIL dictated note to the homebrew newgroup.

PLEASE NOTE: The following info is a reply to an e-mail inquiry from Rod-VE3INE/W6. I have snipped his message, and am reposting my reply. This is basically a description of my hardware setup using M$ Dictation.

Hi Rod, and glad I posted that in a timely fashion. I use a lousy condenser mic, in a handheld enclosure, that is really very cheap. The MS program recommends the type you are looking at (boom), but it really supports just about every type there is. That is one of the first things that get setup, and even if you don't have mic...the program will make recommendations for you. The mic is made by LABTEC, known for cheapness.

During the initial setup, you speak a phrase, and the mic level is automatically adjusted so it should not really matter what you use if it has enough sensitivity. Most small condenser mics are highly sensitive over the older dynamic types.

I just purchased a new cheapie Creative Labs 16bit WAVEFFECTS board ($75 with $25 rebate) to replace my old 8bit sound card. That is all I am using, with a homemade pentium166/32meg RAM. Nothing spectacular here, but sure got good results.

The trick is to follow the instructions and have a QUIET environment when doing the initial training session..about 15minutes. That is all I did, and those were the results I got. There a lot more training exercises to go thru, at your leisure. All in an effort to better the accuracy. They claim 80-90% initial accuracy, and with more training..approaching 95%.

The program is very good, full featured, and has a large vocabulary. Lots of business and marketing related words, at least in the few exercises I have gone thru. So that may be a clue of where this program is heading. But for now its FREE, fully featured, and a bargain at any price. You speak into their notepad-like 'dictation pad", and from there you can just copy paste into any application..at least that's what I did.

They claim it will work in ANY application, I haven't tried that yet..as I am still learning. Try it out, and send me a post of your impressions...as well as posting to the group. It might be kind of fun to compare notes.

I remember back over a decade ago, making some wire-wrapped HARDWARE boards to play with speech (speaking out files). I thought some hardware types might enjoy playing with this on the ham RTTY/packet bands, hence posting to the homebrew group. I may cut and paste this reply to the newsgroup, as it may answer a few more questions that might pop-up. Good luck Rod, and happy recognizing...

I built one, including tracking generator option. It isn't lab quality, but
it is a useful instrument.

Nope. It just says no more than one a year for external amps
operating below 144 MHz. I suppose that would mean that you
can't make more than one 10m external receiving preamp a
year either if you went by the letter of the regulation. But the
FCC seems to define external power amplifier as something
which follows a transmitter and has more than 0 db of gain
at frequencies around those used by CB.

For an even smaller 12 VDC generator, a friend of mine mated
an auto alternator with a weed wacker engine on a small wooden
base with carry handle. The trick is to use a flexible coupling
between the shafts. I wouldn't have thought this would work
because of the high RPM the weed wacker engine has to turn
to generate power, but it does, and makes a great ultraportable
source of 12 VDC for charging batteries or jump starting cars.

The downside is that a weed wacker engine is only rated for
about 25 hours operation at full power. After that, its junk. So
this thing is definitely suited only to intermittant operation.
But it only weighs about 10 pounds.

The only thing that might be done differently would be in the antenna
matching section if the radio is designed to work with an unbalanced
antenna which is required to work against Earth.

>I'm thinking specifically about RF bypass capacitors. Wouldn't these
>devices work better with "better" grounds? I remember the little
>experiment that they do in high school physics labs where the
>electroscope can transfer more charge to a metal plate if another
>metal plate is parallel to it ... and it can deliver even more charge
>if this second plate is connected to the earth.

Nope. That's *static* electricity. What RF bypasses handle is anything
but static. The return currents go to circuit common. We often call that
"ground" but it has no relationship to Earth. The function of bypass capacitors
in a circuit is to close the circuit for RF currents. The point of closure is
circuit common because the source of the current is generated with
respect to circuit common. It's the old "it takes two wires to make a light"
business. The circuit has to close, and circuit common is used as one
of the "wires" to provide that closure. It has nothing to do with Earth.

>I have an old tube type shortwave receiver (Hammarlund HQ-100). It
>squeals like a banshee if it is not connected to the earth. Is this
>squealing related to the little physics experiment described above?

Sounds like you're getting feedback, and that could be due to a bad
circuit connection to chassis, either a failed bypass or just a bad solder
joint. So now the only return path is stray inductive or capacitive
coupling of the circuit via the chassis. Connecting the chassis to Earth
can load down that capacitance and reduce the amount of feedback.
But that's not a fix, it is just treating the symptom. You don't ever
want to have to depend on circuit strays for stability.

881. Calculating coil self-resonances

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-24 00:00:00 UTC
From: k7itm@aol.com
Message-ID: <19980124181700.NAA12478@ladder02.news.aol.com>
Source record: 87004

I posted this from my account at work two days ago, but wonder if it ever got out at all. It never made it here. But I think this is info that quite a few
others have expressed interest in before...

I've posted requests before for info on calculating the self-resonances in standard single-layer RF solenoid coils, and nobody has come up with anything for me. But now finally in the latest "RF Design" magazine, there's an article that covers it. Thankful for anything I can get in this area, I downloaded the shareware "coil.zip" file from the web site referenced in the article (www.saratogasoftware.com), and find it to be a useful DOS program (that runs in a Windows DOS shell if you want) for general inductance calcs and practical coil design, as well as a predictor of the self resonances. The shareware fee is quite reasonable...and interesting. Oh, the article is "Modeling helical air coils for wireless and RF applications," by John A. Mezak, on Page 77, January, 1998, "RF Design." By the way, the website also mentions that Fig. 6 in the article is missing a legend on the right axis for DB[S21], which should go from 0 to +50 in 10dB steps.

(Sorry if this duplicates a message I sent out a couple days ago from
my account at work, but it never made it to here, so I'm thinking it
may not have gotten out at all...)

Does anybody have favorite sources for small quantities of
Motorola ICs, especially RF/PLL ones, in the US? I'd like to
not be faced with too large a minimum order, and someone
that has reasonably complete stock of current production
parts would be nice. I like DigiKey fine, but they don't carry
Motorola AFAIK.

Cheers,
Tom

Message-ID: <19980124184500.NAA16770@ladder02.news.aol.com>
Source record: 87007

You may have found out about hardware cloth by now. It is a galvanized screen wire with large spaces between the wire. 1/4 to 1/2 inch square openings are common. Check with lumber, hardware, or even feed stores for sources of hardware cloth. It comes in rolls. It is stiff and you can cut it with tin snips or one wire at a time with wire cutters. It is commonly fastened to wood using metal fence steeples. Where pieces of it need to be joined it can be laced together with soft wire. It is used to make small animal cages and traps. It can be put over openings to keep rodents out. You can use it to make antennas - especially reflectors and ground planes. Good Luck.

885. Re: Hardware Cloth??? What is it?

Newsgroup: rec.radio.amateur.homebrew

Source record: 87008

Placing a metal ground plane under the fiberglass top is a reasonable idea. Hardware cloth wouldn't look too great but it might help. You didn't say what frequency you plan to use so I will assume 2 meters. Placing some nearly invisible radials on the top of the roof might be easier and work better. If you would like to try something that I have used - get a 10 or 12" circular saw blade and duct tape it down on the roof. A mag mount will stick to it good. To improve on it add radials at least 18" long (taped down also) to see if it works better. After you find something that works you can figure out how to make it pretty. Good Luck.

My experience with a microwave oven transformer was that it was
current-limited. Without smoothing capacitor it worked fine, but with
enough capacitance voltage dropped drastically with load. Different
brands may behave differently. I think transformers should be checked
with regard to this before installing them in the amplifier.

What I use for power out here in the bush of Alaska, will do for you what it does for me. Keep my house, shack, local network, and Telco systems, running 24 hours a day, while only running the genset for 10 hours a day.

Primary Genset 20 Kw Northern Lights Diesel Water cooled.
Secondary Genset 12 KW Onan Diesel Air cooled
House Inverter Trace 4024 4Kw 24 Vdc 120Vac 700 amp/Hr Battery Bank, genset feed
Telco Inverter Lorain 1Kw 48 Vdc 120 Vac 100 amp/hr Battery Bank, genset feed
Network UPS Best 2 KW designed for 30 minutes backup, feed by house inverter
Shack system Newmar 50 amp 14 Vdc charger in constant voltage mode, Genset feed
200 amp/Hrs 12 8D Battery
Main HF Kenwood TS690
1st backup HF Kenwood TS-430
2nd backup HF Kenwood TS-430
Main Vhf UHF Yeasu FT-726RS 6m 2m 70cm with additional Tx amps 100W+
Secondary VHF IC260 2m with 160 Watt amp
Commercial Kenwood TK705H 140-174 Mhz Keyboard programmable
Main Marine VHf SEA-156
Backup Marine Vhf Modar 55/75
Primary HF Receive only IC-R71A
Backup HF Receive only IC-R71A
Primary VHF/UHF Receive only IC-R7000
Backup VHF/UHF Scanner BC-250
Main Data controller AEA PK2232
Backup Data controller PK232
Packet Controller PK-90
Davis Wx Station

All shack gear 13.6 VDC or converted to run off 13.6 VDC from 200 amp/hr Battery outside shack wall

All network Hardware, and cpu's are running off the UPS which is feed by the house inverter

All Inverters are feed from the Gensets

Either genset can be run, and will bring battery banks back to full float in 4 hours and we run the gensets 10 hr/day in two 5 hour blocks 7am to noon 5Pm to 10Pm

All radio's that have data inputs are controlled by cpu's on
the network, Data controllers also are connected to networked cpu's.
Antenna Rotarors, and other shack equipment are driven by networked
cpu's and are powered by the house inverter.

Never mind - I didn't spot the "/" before the end. That won't work!

Yes, you are absolutely correct! Since I always double-check URL's before posting them, I assumed others did also. There is enough trouble with bad links, a simple typo should never be a concern. Says me >)

So who would expect to find a "/" where a "." should be?

[... snip HTML dupe of same post]

Hi Mark,

Thanks for solving my problem. But something is strange!

Your URL works fine.

When I go there, I get

http://www.science-workshop.com/

which is the same as the original posting. But if I try that, it doesn't work. I've used URL's with "/" at the end, and they worked fine. Guess I'll just have to watch for that. Thanks!

BTW - do you think you could turn off the HTML?

901. lookiing for lcd display

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-24 00:00:00 UTC
From: lar01@sprynet.com
Message-ID: <34ca3a4a.23493584@news.sprynet.com>
Source record: 87024

I am working on a small project where I would like to display the results on a small 'lcd' type display.

I would like to measure the voltage of a single cell/battery and display whether or not cell is over 1.0 volts or closer to zero.

I Would like a disply similar to an led, but without the current draw of an led, in series with a resistor across the cell. As long as the cell is operating normally the led would be lite. When the cell is exaused, and is reading around 0, the led would be out.

A significant requirment is very low current drain therefore I would like to try an lcd type display.

Any thoughts?

>meter jacks and got the following readings which were more in line
>with what you fellows said you expected:

>Primary Resistance: 0.4 ohms
>Total Secondary Resistance of 3000 V winding: 290 ohms

OK, I'll re-figure, too:
Assuming the 3,000 VCT is "no load:, and based on the article
"Rating Unknown Power Transformers" (by H. Q. Duguid) published
in the July, 1964, issue of Electronics World:

Unit resistance of HV winding = 290/3000 = 0.097 ohms/volt
From Fig. 2 "Unit resistance of h.v. winding vs permissible current"
260 ma - Choke input
190 ma - capacitor input

Plate-to-plate AC voltage into the rectifier under load will be
about 3,000 - (2 * 290 * 0.190) = 2890 volts

From Fig. 3 "Primary current plotted for various primary resistances"
0.4 is one log division to the left of the graph (well, I DID say
1964 was a long time ago and that transformer design had surely
improved in 34 years!) But one division is close enough to
extrapolate:
Primary current should not exceed about 3.5 amperes

The input and output powers are a lot closer....

I need a Foot Pedal with a variable resistor in it for a speed control.

Old sewing machine foot pedal?
Game Controller?
Joystick parts?
Variable-speed grinder pedal?
Musical instrument pedal?

Doesn't have to work, I'm going to modify it anyway.

Need something slightly more rugged but as cheap as the door hinge
I'm going to cobble together to get something going.

Prefer Pick-up in Portland, Oregon.

Thanks, miker

I two different versions: (1) a cloth that has the appearance of a fine suit yet conductive, (2) similar to 1, but it backed with a soft plastic insulator. I use it over circuit boards within equipment to keep stray RF away from RF sensitive circuitry. There are also "molded" versions which are bought preformed in shape specified by the purchaser. I don't remember the mfg. off hand, but I'll look it up when I get back to work. I used both of above to cover my amateur radio shelving, and does reduce equipment generated noise from interfering with adjacent equipment. But it does NOT replace a copper ground bus system.

ok, here goes. open to arguement of course.

the stock transformer behaves poorly with a bad power factor at
light loads, and much circulating current from the ac mains. The
transformer also acts like it has a ferrite gap in the core and
will act like it is in saturation when you try to get large current
from the secondary. All of mine died like a stone at about 150ma
through a full wave bridge. At most i could generate only about
250 cw watts output from my amp, and the b+ sagged to 1600vdc

Donnie, please don't take any of this personally. There has been a lot of damage done to ham radio by renegade CBers and a lot of us are a wee bit sensitive when we think we see their illegal activities going on. Once you are recognized as a legitimate ham, you'll find out other hams will be quite friendly and helpful.

Lee - the simplest radio receiver you can build is a crystal set. This receives the AM broadcast band. However to use it you will need an antenna and earth and it will only drive an earphone. There is a web page called the 'Xtal Set Society' that has info on these radios.

For stronger reception you will need to use transistors. A regenerative receiver allows good results from a small number of components. There may be a few circuits of regenerative sets on the Net, but you might be better off looking for an older book of electronic projects - these often have circuits of transistor regenerative receivers for the broadcast band and/or shortwaves.

Have a look on my QRP home page (URL below). In the links section there are several links to pages with lots of circuits. Also on my page is a feature called Novice Notes Online for the beginner to amateur radio. There is a section on 'homebrewing' that has information on building radio projects.

Good luck.

Peter

Hi,

I have looked this over after putting up a page
on 'how the spectrum analyzer works.'

http://www.lakeweb.com/dbLabs/spectrumAnalyzer/intro.shtml

I had questions like:
What happens when you sweep through the IF? The article
doesn't mention dual conversion. If it is just a detected
output, it won't have much dynamic range. Pretty important
for a spectrum analyzer.

Once we are done with the move we are making, I plan on
building a new one that could easily be duplicated using
the AD606. It would mean good dynamic range and accuracy
at a very low cost.

I will post here as I get the pages up.

Thanks, Dan.

915. Icom CI-V data specification

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-25 00:00:00 UTC
From: Roger Palmer <rpalmer@islandnet.com>
Message-ID: <01bd29dc$c0e7c2c0$36ac35c6@Roger.islandnet.com>
Source record: 86944

I am currently building a microprocessor-based control unit for a Harris 601 antenna tuner. The unit will interface my IC-735 and linear amplifier to the Harris remote antenna tuner, which contains a motorized inductor and vacuum variable capacitor, as well as a phase discriminator. The controller will be based on the PIC16C74 microprocessor.

The software algorithms will take control of the IC-735 transceiver, putting it temporarily in FM mode while the key line is activated to generate a carrier while matching proceeds. Having examined Icom's AH-2 antenna tuner, I gather that this mode change to the transceiver is done via the CI-V port. After tuning is complete, the transceiver is restored to its previous mode.

CI-V is a bidirectional serial data port available on many Icom transceivers. I believe that it communicates using CMOS voltage levels at 1200 baud.

Does anyone have information as to the data structure used to communicate via this port? I could presumably learn some of this by watching an AH-2 and 735 communicate while logging data to a PC, but it would be much preferrable to have information on the actual protocol.

I am looking for a service manual for my Heathkit SB-200, if anyone out
know where I can get it?

And also I am looking for the mod for SB-200 to work on WARC bands.

Thank you very very very much!!

The Military transmitter T-368 (a really FB rig that was the successor to the BC610) uses a formed metal chimney for it's 4-400 final tube, but only covers up to 20mhz. You might run into some additional problems with the additional capacitance on the higher frequencies.

hi, as some have pointed out, a generator is the way to go. also think
about
solar panels. check out home power magazine, they usually have an
article or
2 on how to get self sufficient power.

Hi Lee
Well, as I recall, Radio Shack has some interesting radio kits.
You might also find some companies, on the internet, that sell radio
kits.

Insofar as an upgrade to the CPU goes, I think you may have heard about the CPU clock speed being a bit on the fast side. I had a problem getting into my own UHF repeater with the VX-1R. The problem appeared to be the P.L. encoder in the radio. Well it turned out to be a bit of both. I ended up removing and replacing the tone reed in the repeater as it was hearing a little low, and the VX-1R was encoding a little high. I talked with one of the engineers at Yaesu, and he pulled a couple off the ass'y line and told me they had the same problem. Solution to my problem was to send rig back and get adjustment.

>can give me an idea of how many watts this thing is good for? It
>....
>Primary Resistance (115 VAC) : 1.8 ohms
>Secondary (3000VCT) Resistance : 152Ohms + 152Ohms = 304 ohms total

Assuming the 3,000 VCT is "no load:, and based on the article
"Rating Unknown Power Transformers" (by H. Q. Duguid) published
in the July, 1964, issue of Electronics World:

Unit resistance of HV winding = 304/3000 = 0.1 ohms/volt
From Fig. 2 "Unit resistance of h.v. winding vs permissible current"
250 ma - Choke input
180 ma - capacitor input

Plate-to-plate AC voltage into the rectifier under load will be
about 3,000 - (2 * 304 * 0.180) = 2890 volts

From Fig. 3 "Primary current plotted for various primary resistances"
Primary current should not exceed 1.35 amperes

I see a LARGE difference in the permissible input power and the
possible output power. This article is 34 YEARS old, and power-
transformer design may have improved considerably since 1964.
I routinely use the article, however, to "spec" old TV transformers,
and have found it to be quite reliable for such "junque".

I'd like to hear more on this. Do you mean sampling the output from 0 to
50 MHz? Wouldn't that mean more spurs to eliminate, and where are you
going to get a 100 or 200 MHz sampler? And how are you going to get it
into the PCI bus to work on it?

Sounds interesting - if the added noise can be overcome.

> > Of course, you need a companion tracking generator, so it would have to
> > be designed in from the beginning.
> >
> I was going to keep this in mind.

So, how are you going to get the frequency offset? For fairly wide
sweeps, the tracking doesn't have to be so good. But what if you need to
use narrow bandwidths for better s/n, or whatever. It's going to be fun
generating an offset frequency equal to the first IF, between 2 - 4 GHz,
and keep it in a narrow IF. Any ideas?

> > Shielding will be a problem - 95 db dynamic range is plenty, but keeping

Got to find ones with close-fitting lids - perhaps with a way to mount
microwave mesh gasket or contact fingers. Maybe even a box-within-a-box
for the really tough parts.

[...]

OOooow - that is a good point. Actually, I hadn't got that far, and was
kind of thinking along the lines of a plug-in card for the ISA bus.

Obviously, that would suffer from CPU clock harmonics and all the rest of
the crud on the CPU motherboard. Anyway, the plan was to somehow get the
data into the CPU for analysis and data logging. But that may turn out to
the toughest problem of all.

Well, my old HP8551B has a fairly simple conversion scheme -- the first LO tunes from 2 to 4 Gc (it's too old to be GHz :) and works into a 2 Gc 1st IF stage, for coverage from 10 Mc to 2 Gc on the LO fundamental. A more stable, modern LO, together with a decent mixer, would allow you to extend the lower limit as low as a few kc. No spurious responses are possible with this architecture for any signal below 2 Gc, which is nice.

The 8551B follows the 2 Gc IF with a conversion down to 200 Mc, where the majority of the IF gain occurs. This is followed by a final conversion down to 20 Mc, where a series of crystal filters in the display unit provide the various resolution bandwidth options.

For dedicated HF/low-VHF work, I think the HP8553B plug-in for the 141T converts 100 kHz - 110 MHz up to 200-300 MHz? Something like that, anyway. Again, with such a relatively high first IF, it doesn't take much filtering to eliminate spurs. A high first IF for an HF analyzer also lets you keep the LO tuning range well under an octave, simplifying things considerably if you aren't using a YIG.

>1. Still wondering what center frequency is most common.
>Mark signals are (always?) on 1275. The space frequency depends on the
>shift of a signal.
>So how can you say that there is ONE center frequency?

On an FSK signal, the relationship between the RF frequency and what your decoder needs is arbitrary. The audio signal frequency comes from the difference in frequency between your BFO and the signal in the IF amplifier in the detector. Out there in the rest of the world, there's just a signal at one RF frequency or the other (and bunch of FM sideband stuff which is irrelevant for this discussion). And the center frequency would be the average.

>2. Also: isn't the mark frequency the actual frequency of a data
>station?

Not sure, there's probably an ITU or FCC definition for this. Looking at the FCC regs (Part 2.202, they define deviation as half the difference between the maximum and minimum frequencies, so it looks like center frequency, not mark frequency.

Also, you need to know how your receiver reads out the frequency. On my old Kenwood R-1000, it reads the center of the IF, and there a 1.4 - 1.6 kHz offset to the zero beat frequency when running in SSB mode. With receivers that have a higher resolution (than 1 kHz), you can have all sorts of choices, like displaying the BFO zero beat frequency (useful for SSB voice), or adding in a fixed offset to the BFO (useful for CW). And then you can screw yourself up by switching the BFO frequency to the other sideband to invert the signal instead of using an inversion in the decoder.

>3. I wonder when you use a decoder with a fixed center frequency along
>with a radio control program, you can tune the station 'in the middle'
>of the center frequency, just by tuning in via the database??

Garbage In, Garbage out. Depends on your database. Back when I was doing a lot of this, there were a lot of published loggings that were just the receiver readout, not taking all the frequency offsets into account. Spurious precision, but they got some number good to 100 Hz even if they were off by about 1 kHz.

Here is my experience re UPS: I bought my battery backup components
from a large marine supply store. My battery charger system is a
GUEST Charge Pro 10 amp unit. It has 3 levels of charge and
maintenance, highly recommended, $79.00 . There are others and more
expensive. The battery is a 12 Volt marine deep charge and starting
battery from Sears, $99.00 . This one runs my SGC PowerCube.

This battery charger puts out receiver hash while under heavy charge
so something to consider. It is sealed and water proof in potting
material and plastic, no sheilding metal. I don't recall if the UPS
puts out hash. Yes, filters are on the AC and DC lines.

Recently I put a UPS on a moderate phone system using the SMARTUPS
from APC. This unit let me add battery modules to the point of
getting 6 easy hours out of the phone system. However, nothing says
you cannot add your own batteries. My largest UPS experience is with
500KVA system, filled a room.

937. stepper motors & remote KW antenna tuner

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-26 00:00:00 UTC
From: bprats@telis.org
Message-ID: <34cbee16.3914004@news.campus.mci.net>
Source record: 86954

I'm collecting stepper motors from floppy disk drives, hard drives and a few other surplus sources. I've also a stepper motor IC , EDE-1200 from E-Lab engineering. These are base components for a remote tuned or auto tune 1KW plus antenna tuner.

What I'm trying to do is build a remote high power antenna tuner and could use everyone's input and ideas for the control circuits and stepper motors. So far, the idea is to mount the tuner at the end of the balanced feeders to a dipole or 17 foot marine vertical. Since a small auto tuner DOES tune a simple antenna to most HF bands, this tuner should be as effective but have 1000 watt output capacity or better.

I could go the SGC235 route but it is limited to 500 watts, not bad but at $1,100 plus, pricey . The tuner circuit will probably be out of the ARRL handbook, page 22-59 . Also for interested parties, the web has lots on 'step motor' , do a yahoo or alta vista search and check out Jones on Stepper motors.

Specs: Auto sense or remote tuned via stepper motors.
Parts collection : WWII flat wire roller inductor, EDE-1200 stepper controller chip, variety of small stepper motors, metal chassis base, water proof enclosure, solar and gel cell power supply for remote power, no DC lines wanted.

Has anyone been involved in such a project and care to share notes ? Recent station changes allow me some time to work on this idea.

Thanks ..K6ACJ e-mail bprats@telis.org

938. GE MARC V Schematic Wanted

939. Simple low power AM transmitter for personal use (50mW)

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-26 00:00:00 UTC
From: wa2ise@netcom.com
Message-ID: <wa2iseEnDHK9.GFH@netcom.com>
Source record: 86956
Cross-posted to: rec.antiques.radio+phono,rec.radio.amateur.homebrew

I designed and built a (relatively) simple AM transmitter, diagram can be found at: http://www.geocities.com/CapeCanaveral/9178/amxmit.gif (type out all the abovve path, it's not linked to anything yet).

It produces around 50mW or so, enough so you can play OTR or other audio material into a nearby old AM radio. You'll need to have the antenna near the radio for good signal to noise. And the power should be low enough to not interfere with someone else's reception or have the funny cookie corporation care.

The parts used are not critical, similar function parts should also work.

940. VFO Plans

Science Workshop is not the only source for this sort of thing, though they may be the only company that is selling kits. I thought the idea of using a tv tuner as the front end of a "spectrum analyzer" had originated in an article in one of the ham magazines, and then Science Workshop took the idea and did some improvements, but I'm not certain.

There have been a number of articles about the same basic concept over the years. There have been some very simple ones, while others have been a lot more serious. It probably is worth looking for those articles, though I don't have any exact references handy. I've seen the idea in Radio Electronics, Electronics Now (which used to be Radio Electronics), Communications Quarterly, and I've seen references to articles in Ham Radio and QST.

Once you have the basic idea, then you can start improving it if you feel up to it. There was a recent article in Communications Quarterly that took the Science Workshop analyzer as a foundation and made significant improvements, especially in the area of dynamic range.

There was also a very good article in Ham Radio, in 1977 I believe, by Wayne Ryder. It only covered a hundred MHz, which is small compared to these recent projects, but large at the time. This was before the idea of using tv tuners as the front end so that part was built from scratch. On the other hand, it did make for a better analyzer. It also featured a narrower bandwidth than many we are seeing these days, and some details about the tradeoffs. There was also an attempt at making the tuning linear (or at least more linear), and the IF strip was a log amplifier.

Melissa, for detailed, non-technical designs for a variety of receivers, try "Radio Receiver Projects You Can Build", 1993, by Homer L Davidson, published by Tab/McGraw-Hill. You will probably have to order it from the publisher or have your local bookstore order it as it is not commonly found. There are lots (33) of radios from simple crystal sets through TRF, Regen, Direct Conversion, Superheterodyne, and using tubes, transistors, and ICs, so you have a really wide range of technology represented in one easy to follow book. I highly reccomend it to the non-techie. You WILL be able to get a radio built, up and running with this book.

Science project, huh? We saw one post already today on the subject. might you be classmates? Well, I/m a soft touch for a YL of any age, so Papa Robinson will make another suggestion: What goes good with a receiver? A transmitter, of course! Radio shack has a booklet entitled "Engineer's Mini-Notebook: Communications Projects" by Forrest M Mims III, catalog # 276-5015. There are a handful of interesting things in there... Telegraph, intercom, CW (Morse Code), AM voice, Even how to send your voice over a beam of light. Again, this is a very non-technical book(let) and there are no expensive or hard-to-find parts. Get the book, read it, come up with an original idea, (after all, your science project should be an experiment, not just a copy of somebody else's work, right?) and trot right back to Rat Shack with your nickles and dimes for the parts. You might even learn something. Let your science teacher see the book and she'll probably make it required reading!

Do be mindful of a few rules should you decide to build a radio transmitter. The projects in the book are all of very low power and are legal to operate AS LONG AS YOUR TRANSMISSION DOES NOT INTERFERE WITH ANYBODY ELSE! If you can pick up your signal from more than a few feet away, it might be a good idea to trim your antenna a bit, which will reduce the strength of your signal. The light beam transmitter and receiver might be a better project for this reason.

If you REALLY want to do your homework, there are a whole lot of government rules and regulations in a massive series of books called CFR: Code of Federal Regulations. They are divided into TITLES, and each part is usually made up of several books. Further subdivisions are called PARTS, and each book usually has several parts. Find CFR Title 47 Part 15 for the lowdown on low-powered

transmitting devices. I warn you, though, it is prettty boring stuff for an adult, and probably moreso for a kid. You will have to go to a city or college library to find it, I imagine. Don't feel bad if you get disgusted with it early on. You wouldn't believe the arguments we have on these ham newsgroups over part 15, mainly cause we all hate reading that stuff to get the straight answers!

You do need to be able to rattle off the reference to part 15, though, if anybody asks whether your transmitter is legal or not. Explain that your transmitter is under 1/10 watt and your experiments verified that it does not cause illegal interference.

Good luck with your project, and keep us up to date on it.

Dan,

Hurry up with the move - I've been thinking of an AD606 version, with a 2-4 GHz first oscillator and up-converting to get rid of problems sweeping through the IF.

I was thinking of using the AD DDS chip (don't have the number handy), and phase-locking the first oscillator for close-in work.

Of course, you need a companion tracking generator, so it would have to be designed in from the beginning.

Shielding will be a problem - 95 db dynamic range is plenty, but keeping all those spurs out will be fun. I am thinking of small, fully-shielded compartments, with the vco's completely separated and shielded from the phase detector and prescaler.

Then have two separate buffers, one to go back to the phase detector, and one to go to the mixer through appropriate high-pass filters. This hopefully will help keep the phase-locking spurs out of the mixer signal.

I don't think the electronics will cost that much - it's the shielding and filtering to get clean signals that will be tough!

Hmmmm.... (I love beginning a post with that!) aren't those little battery
checkers on the alkaline battery packages just an LCD over a composition
resistor with a taper? Might make a decent crude bar-graph. I wonder what the
current draw is... too bad I don't have one handy. Can trim and/or pad the
checker's resistance to set limit and zero to convenient places on the strip,
calibrate a scale....

la8ak@xnd.k.nor (J M Noeding)
shared these priceless pearls of wisdom:

->>It is a neat trick using an FM detector IC. The same idea has been seen
->>in other articles, but using separate IC's. The QST article mentioned
->>below does it, using an NE602 as the balanced demodulator. Years ago,
->>you'd see the same thing done with an MC1496 as the balanced
demodulator.

->I once made a morse demodulator using MC1496P where signal input was
->connected to pin 1 and 8. The two outputs where combined using a 741
->unity gain amplifier. It worked ufb, and seems possibly to be one of
->the best cw detectors I have made, but my apple 2E+ computer did not
->last forever, and I believe a better morse decoding program might have
->been written......?

Oh, FINALLY the light dawns. You aren't using the chip for anything but AM demodulation. It isn't the IF amplifier, nor does it provide any amplification at all. The raw IF signal is presented to both the limiter input AND at one port of the balanced demodulator. The limited signal is used as a constant "local oscillator" (to bend a phrase) to the other port of the balanced demodulator. The "beat" signal between the limited IF signal and the raw IF signal is the audio you are trying to detect.

Did I get this approximately correct? I'm sometimes slow on the pickup.

Look in Radio Shack for a RADIO LAB or something like that.
You hook wires from one point to another, and it looks spiffy in a
sci-fair project.

Don't know what they cost for the small ones, but it used to not
be very much, and you could do several projects on it.

More, actually, than the instruction book shows.

Hope this helps.

Hi all!

1. Still wondering what center frequency is most common.
Mark signals are (always?) on 1275. The space frequency depends on the shift of a signal.
So how can you say that there is ONE center frequency?

2. Also: isn't the mark frequency the actual frequency of a data station?

3. I wonder when you use a decoder with a fixed center frequency along with a radio control program, you can tune the station 'in the middle' of the center frequency, just by tuning in via the database??

Yep, 3 questions... when you have any opnion/answer etc to one or more of them, please let me know.
Any contribution will be very appreciated!

Jim, there was a QST article from 1992 or 1993 which describes exactly
this. I breadboarded the stuff in that article for fun one weekend.
It had two detectors. One of them was just as you describe. The
other was a real synchronous detector which used the FM quadrature
detector as a VCO control line.

As you might suspect, the limited carrier system works, but not quite
as well as the full FM-detector-driving-the-VCO synchronous detector.
I believe the article called the former method "Quasi-synchronous"
detection. As long as selective fading doesn't reduce the carrier
below the level of the AM sidebands or some other interfering signal,
it will work, and it can sound pretty good.

The advantage of the "Quasi-Synchronous" detector is that aquisition
of the AM signal is immediate. There is no waiting for the detector
to "sync-up." I suppose had we attempted to build some kind of lock
detection circuit, we could have made selection of the carrier source
automatic. I never went that far, however.

Hi Mike!

I was thinking 1.x to 2.x and then harmonics mix to go
higher. I have a couple of 2-4 yigs. But that would really
push on the cost.

> I was thinking of using the AD DDS chip (don't have the number handy),
> and phase-locking the first oscillator for close-in work.

If the ad606 had a RF log output you might be able to
DSP 50 MHz at a time. It would also lead to very accurate
frequency processing at low cost.

Those inexpensive thin sheet metal boxes for PC mounting,
(Allied sells them), is what I would hope would do the
job.

Also the display. I was considering digital by the time
it gets there. The display on the TDS scopes is inexpensive
and very easy to look at. The chips are dirt cheep now for
doing monochrome VGA. TTL might work but won't look as good.

More later, my best, Dan.

You could use the Harris CA3318 flash A/D digikey sells them.
It works up to 15 MHz (Video is under 5 MHz).

Hope this helps - Mark.

> More later, my best, Dan.

Some thoughts:

1) You want to avoid spurs in the design stage, not just by throwing shielding at the problem. :-)

2) Instead of rolling your own analyzer from scratch using junk like TV tuner modules, another alternative might be to start with the guts from an older 491 or 141T plugin, and add computer control and display capabilities to it. These units had perfectly good mixers, LOs, filters, and log detectors, but lousy displays and awkward user interfaces.

Dead examples of this type of gear can be found fairly inexpensively. And computerization is just what these old "classics" are crying out for. I remember seeing a quote awhile back that I found especially poignant -- something to the effect of "The microprocessor saved the spectrum analyzer, just as it killed the oscilloscope."

3) For the display side of the question, IMHO it doesn't make any sense at all to homebrew this, when you can build a simple parallel-port interface to dump the output of the log detector to a convenient laptop or other PC. You can handle almost all display and control features in software with minimal hassle, and end up with a very competent instrument with the ability to automatically configure its controls, run automated tests, save and print traces, etc. Life is too short not to use off-the-shelf components whenever possible.

4) If you have your heart set on building the RF section from scratch, don't overlook the vast array of junked sweep-generator plugins for the older Wiltron and HP mainframes available at almost any flea market. These things can often be had for as little as $100-$200 or so, and contain YIGs, fixed-frequency microwave oscillators, mixers, filters, UHF/microwave gain blocks, and tons of miscellaneous spare parts. With some creative scrounging and a good set of crystal filters salvaged from a 70s-vintage instrument like an HP8552, you could build a PC-driven spectrum analyzer that would compete reasonably well on many fronts with some very modern, very expensive gear. Challenges associated with building an analyzer around parts from a gutted sweep-generator module

would include LO stabilization for narrow span widths, and IF filtering. Neither of these are trivial problems, which is why I think starting with the subassemblies from an older spectrum analyzer is a better overall approach.

970. HamComm Interface

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-27 00:00:00 UTC
From: Richard messick <rmessick@map.com>
Message-ID: <01bd2ad3$41b52ae0$451347cc@Map.map.com>
Source record: 86893

Does anyone have experience in building a HamComm interface? I have followed the "receive only" schematic provided in the program documentation (ver. 3.1), but the interface does not seem to work. I have conducted all of the troubleshooting and diagnostic steps provided in the manual (many times!), but to no avail. The interface and serial port outputs check out o.k., but the spectrum analyzer function indicates a non-operational interface (there is some "grass", but it is quite scattered and at the lower end of the spectrum).

I am using a Toshiba 730CDT under Win95 (although the program must be run under DOS for the evaluation version, which I have). This is connected to the phone jack of a Transoceanic DY7000 via shielded cable. Is there something I don't know about the serial port outputs under Win95 in the DOS mode (run under DOS, not a DOS window - that doesn't work) ? The interface seems to function as it should, so I suspect something about the serial interrupts . . . Does anybody have any experience or ideas on this one? Thanks for the help!

-Dick Messick

You could try doing a web search for the SUPERVXO that was described here awhile back that was produced by a Japanese ham. The circuit diagram is simple and was available from several web sites. A VFO would be overkill, and too tempermental. That VXO will give you plenty of swing when multiplied up to 144mhz.I believe it was a single transistor device using TWO crystals.

How about old consumer electronics? Specifically (but not exclusively) old console TV sets. You still find an occasional one of these junkers in the tall weeds, on the curb, or next to a dumpster. The older the better, and if you latch onto a VHF-only junker, you will find about three dozen of the coil forms you want inside the tuner.

You might also be able to clean out somebody's garage or basement and get one for free.

Lou Hinshaw wrote:

> Look in old ARRL manuals.

Normally I complain when people say "look in old ARRL manuals" but the truth is that the ARRL Handbook has _always_ carried several schematics for antenna tuners every year since before fire was invented. So any Handbook (including the Antenna Handbook) will have plenty of ideas.

1997 Handbook, p. 22.59 shows a figure with several tuner configurations. One of these will work for you, and you won't need to exactly duplicate the whole project.

A roller inductor is nice but not necessary -- even so, you should be able to find a relatively inexpensive ARC-5 surplus roller at a swapfest or out of somebody's junk.

For QRP, you can use mica trimmer caps and make some plug-in inductors to stick in an FT-243 crystal socket.

From: Jim Strohm <jstrohm@taxes.net>
Message-ID: <34CDF9B6.4079@taxes.net>
Source record: 86904

The "why" is -- there are three kinds of people who
buy and sell the old ARRL handbooks.

Some of us here use the information in the old
ARRL handbooks.

Some of use collect the handbooks, because it's kinda
fun to have a shelf full of fond memories.

Some of the (ab)users here buy up as many old handbooks
as they can, and then sell them at outrageously high
prices to the first two types of people. I'm a little
disappointed at how many hams have started trying to make
a living off of the hobby, but I guess I can't squeal too
loudly -- a lot of folks around here saw me make what
looked like a lot of money from dealing old ham junk back
in the 1980s.

Fact is, if I don't include gas, tires, and beer money, I think
I broke even on the whole deal. Maybe. But like the people who
get hooked into MLM, they confused activity for profitability --
my sole interest was FUN.

So I guess there's a fourth kind -- people who do it for fun.

That seems to be the approach we're thinking of. Now, how do you get a tracking generator to follow the first LO without causing humongous (RFI, feedthrough, crosstalk, interference - you pick the word!)

> The 8551B follows the 2 Gc IF with a conversion down to 200

Presumably the first IF is actually 2.2 GHz, or the input range is really 0-1.8 GHz and the first IF is 2 GHz.

Obviously, the second LO wants to be above the first IF so it cannot appear as a spur. There may be some IMD products with the presence of two mixers and all these local oscillators floating around, but that will be the fun part!

Presumably, a sharp low-pass filter at the input will help keep stuff above 2 GHz out of the spectrum, and sharp high-pass, bandpass, notch, or combination of all three will be needed to keep 200 MHz input signals out of the first IF due to first mixer feedthrough.

The trick will be to find out where these filters have to go, and what kind of performance they need.

That gets us to 200 MHz, where there are plenty of low-noise amplifiers available cheap. Also, the hams have a lot of

experience with 2-meter repeaters, so getting good 3rd intercept performance should be a piece of cake.

> the LO tuning range well under an octave, simplifying things
> considerably if you aren't using a YIG.

My heart wants a yig - lowest phase noise. But I understand they are a devil to keep stray magnetic fields out, and you have to keep the noise on the dc control voltage down to microvolt levels. That would mess up a fast PLL loop, so the sweeps would end up slow.

Of course, the latest Tek and HP spectrum analyzers seem to be able to handle 1 Hz resolution at 40 GHz. So we know it's possible - but I'd sure like to know how they do it!

Once the signal is available at 200 MHz, everything is a piece of cake after that. 95 db dynamic range log amps, DSP signal processing, software for analysis and data logging, ...

Then, the next step is to extend the full sweep to 20 GHz - easy. Just multiply everything by 10 :)

Well, my ISP seems to have hung - I don't know if this will cause a duplicate post, but I'll try.

>Is the 4046 any good as a VCO?
>One Chip, One Cap 2 R's, simple.

>What are it's big faults?
I actually built a VCO for a phase-lock-loop one time. It was relatively
stable, and had a fairly good range.
BUT
when I leistened to the "CW" on a communications receiver, yeucchhh!
the "phase noise" was very wide and loud. Sounded sorta like rubbing a wire
with a file!

>Anyone used this in a radio?

I think you would be better off going to an LC-varicap VCO!
Built a colpitts VCO for the same project --- used some surplus (3/$1) varicaps
and got a comfortable 2MHz tuning range. (that was about 1.4-1). Sounded good
on the receiver, and I could tell by the sounds it made exactly when it locked!

Regards,
Ed

984. Wanna Buy Why?

There are several kinds of people wanna buy.
Some say you should remember we are all hams
together, and we shouldn't act like merchants.
Some ARE merchants, honestly and up front.
some are the one, pretending to be the other.

Someone asked for a vintage ARRL manual and
I asked why? No answer.What he/she want it FOR?
Non of my business, I guess.

BUT, if I got one, it's because I see a use for it.
If we are all hams together, one big happy fam,
then I got no objection to passing off a book I
might not use for a long time.

Unless this is a merchant trying to get all they
can for nothing.

Sheesh.

>Can someone point me in the direction of the equations for figuring the
>L for coils wound on ferrite or iron core rods? I have some Amidon
>stuff but this relates to torroids.. Thanks...

The calculation of the inductance of a ferrite rod is an inexact science.

Start by calculating the inductance of an air core coil of the same dimensions.
This, in microHenries, is approximately d*d*n*n/(18d+40l)
where d = coil diameter in inches (wire centre to wire centre)
l = coil length in inches
n = number of turns
(Ref. ARRL Handbook, 1998, p 6.22)

Insertion of a ferrite rod increases the inductance by approximately a factor
of 11-13. This depends upon the position of the coil on the rod, and the
length of the
coil. For a short coil at the centre of the rod, the factor is approximately
13. This
decreases as the coil is moved along the rod. When it is moved half way from
the centre to one end, the factor is about 12, and 3/4 of the way it is about
10.
This is taken from a graph in 'Ferrite Rod Aerials', , W.A. Everden, Wireless
World, Sept. 1954, pp.440-444
Elsewhere in the article he states that 'the inductance ratio of a coil with a
ferromagnetic core to that of an air-cord coil will be approximately 11:1'

Hope this helps

>with something a small minority is interested in. Those buyers will
>have to use an older radio instead!

The reality is that there has never been a large demand for, or use
of, transverters with HF radios in the first place. And now there is
even less demand and reason for them thanks to the popularity of
VHF+ multimodes and the expansion of most HF rigs to include
6m. The transverter jacks (and associated internals) have become
an unnecessary expense in a market where price competition has
become increasingly cutthroat.

Now I'm not happy about that, because I'm in that small minority
who use transverters, but that's the reality of the situation. To
most purchasers of HF rigs, transverter capability is about as
useful as tits on a boar hog. Those of us who do use transverters
likely have the expertise to modify a radio to work with them in
any event, so the issue is really moot.

> causing humongous (RFI, feedthrough, crosstalk, interference -
> you pick the word!)

Typically the tracking generator doesn't "follow" the first LO per se -- it makes use of the actual first LO signal. The idea is to bring the first LO signal out of the analyzer chassis somewhere (the 8551B has this jack on the rear panel, but the 8554 and Tek 492 have it on the front panel.) The tracking generator mixes the first LO signal with a fixed-frequency oscillator representing the first IF frequency (this oscillator is usually manually tunable over a very narrow range, to account for variations in the actual IF frequency). The resulting signal is run through a filter and a levelled amplifier and used as the tracking generator's output.

So tracking generators are really trivial beasts. I have an HP8444A generator, for example, that connects to an HP8554 analyzer plugin for the 141T. It accepts the first LO signal at 2.05-3.3 GHz, plus the 3rd LO signal at 500 MHz, directly from the front panel of the 8554. At narrow sweep rates, the 500 MHz 3rd LO is the one that's swept, rather than the 1st LO YIG. (This seems to be done a lot in PLL-stabilized instruments, since their stabilizer circuits are designed to keep the YIG running at a fixed frequency and sweeping the YIG at the same time you're trying to keep it phase-locked would pose an obvious problem.)

At any rate, the ~500 MHz 3rd LO is mixed with a manually-tweakable 1.55 GHz internal oscillator within the 8444, to yield the ~2.05 GHz signal that's mixed with the 1st LO signal to regenerate the tracking signal.

> > floating around, but that will be the fun part!

The 2nd LO in the 8551B is at 1.8 GHz, which is also where the manual rates the end of the first band's coverage. However, the scale goes to 2 GHz, with no spurs visible at 1.8, presumably because of the analyzer's limited sensitivity and the impressive S12 isolation of the cavity-based, grounded-grid 1st IF amplifier.

> > Presumably, a sharp low-pass filter at the input will help keep
> > stuff above 2 GHz out of the spectrum,

Theoretically, yes... however in practice the 8551B uses harmonics of the 1st LO to tune up to 12 GHz, and they don't bother switching in a filter on the lowest (1.8 GHz) band. So spurs from signals above 2 GHz are a real possibility. Not much up there, though, so this isn't usually a big problem. There is an identifier feature that allows you to check whether or not a given signal is a spurious response, by temporarily shifting the LO fundamental a given amount.

> > and sharp high-pass,
> > bandpass, notch, or combination of all three will be needed to
> > keep 200 MHz input signals out of the first IF due to first
> > mixer feedthrough.
> >

Again, they don't bother with this in the 8551B. Any signals at 2 GHz or even strong signals at 200 MHz will cause baseline lift, unfortunately.

> > The trick will be to find out where these filters have to go,
> > and what kind of performance they need.
> >

It's not all that big a problem to begin with, certainly if the budget is there then you can take steps to minimize the problem, but I used the old 8551B for several years without being overly-bothered by it.

> That gets us to 200 MHz, where there are plenty of low-noise
> amplifiers available cheap.

Nowadays this is true even at the 1st IF of 2 GHz. The 8551B uses some sort of exotic tube as its first IF amp, which I've seen in the Alltronics catalog for something like $300. If it ever dies, the thing to do would obviously be to replace it with a $1.98 MMIC and stripline filter. I would expect that 1.8 GHz feedthrough spur to become visible in such a case, though. A small price to pay to save $300!

> Also, the hams have a lot of
> experience with 2-meter repeaters, so getting good 3rd
> intercept performance should be a piece of cake.
>

Generally you don't want to be piping too big a signal into the front end of these older mixers, or you will see spurious mixing products all over the place. 1 mw (!) input to the mixer is the specified maximum of the 8551B, and I think 10 mw is the specified maximum of the 8554 plugin. The newer analyzers (e.g. Tek 492) have much more robust mixer modules that can take up to a wat, plus this latter instrument uses two balanced Schottky diode elements instead of just one, for better LO isolation and (presumably) better immunity to spurious mixer products at high signal levels. I shudder to think of what it will cost if I ever fry THAT puppy. :-)

> they are a devil to keep stray magnetic fields out

Not at all. In my experience they're generally decent with no external shielding at all, but most instruments seem to enclose them in an external mu-metal shield that makes the whole issue a moot point. At wide sweeps, you don't care about a little stray magnetism. At narrow sweeps, you've got to stabilize it with a PLL anyway.

> and you
> have to keep the noise on the dc control voltage down to
> microvolt levels. That would mess up a fast PLL loop, so the
> sweeps would end up slow.

Not usually a problem. The 492, at any rate, solves this problem at narrow sweep spans by bypassing the YIG's main tuning coil with a hefty (several hundred uF) capacitor. This effectively puts a stop to random noise on the main tuning line. The FM tuning coil, which has a much lower sensitivity to noise, is then driven by the PLL. The sweep rates

are still typically pretty slow, but this is due to the fact that you're usually running at a narrow resolution bandwidth if you're running a narrow sweep. I haven't checked, but I'll bet the HP 141T plugins (and newer instruments as well) do much the same thing.

> Of course, the latest Tek and HP spectrum analyzers seem to be
> able to handle 1 Hz resolution at 40 GHz. So we know it's
> possible - but I'd sure like to know how they do it!

Dunno, either. I don't have any experience with the newer gear at all, but presumably the LO synthesizer is much cleaner, and DSP is used to achieve the super-narrow resolution bandwidths. I am actually not sure what use those really narrow bandwidths and span ranges are, anyway. They sure look good on paper, though!

> Once the signal is available at 200 MHz, everything is a piece
> of cake after that. 95 db dynamic range log amps, DSP signal
> processing, software for analysis and data logging, ...

Right, the big problems are all effectively solved with boilerplate techniques at that point.

> Then, the next step is to extend the full sweep to 20 GHz -
> easy. Just multiply everything by 10 :)

Right, or the first LO, anyway. They all seem to rely on simple harmonic mixing for high-band coverage, which can really confuse the picture with spurs on the older/cheaper instruments. The 492 with option 1 has a very nice multi-octave tunable YIG filter that is kicked in on the 1.8 GHz - 21 GHz bands, to serve as a tracking preselector.

AG6K has a great website about amplifiers that deals with this subject.
Check out http://www.vcnet.com/measures/ . Under the topic of Ampli-
fiers, Part 2, he gives some rule-of-thumb formulae for calculating what
you can get out of a transformer.
I disagree with one previous writer who said you could get around 3000
volts from a bridge rectifier, and that this would be OK for a pair of
3-500
tubes. With a bridge and capacitor input, you would get more like 4200
volts DC out of that 3000 VCT winding. Because of the very high second-
ary resistance, you could draw only around 200mA in the FW bridge con-
figuration. This would be 'OK' for more like a single 4-250A or 4-400A,
and wouldn't be worth bothering with, in my opinion. The only way to
get 3000VDC out of this transformer would be with a bridge and choke-
input filtering. There
is too little power capability to waste any on the minimum bleed
current required to maintain regulation with a choke.
If you used a full wave center tap configuration, you could get about
2100VDC no load with a capacitor input filter. You might be able to draw
more like 400 mA or so with this circuit. I will take a wild guess and
say
that you might see 1800 VDC or so at full load. With the high winding
res-

istance, regulation no load to full load will probably be terrible. This

should work fine with a pair of 572B's. Any more than two tubes seems
a waste to me. You could end up with maybe 700 to 1000 watts plate
input, and maybe up to 600 watts or so RF output from a grounded-grid
amplifier. On a good day.
With that high secondary voltage, many layers of windings are needed,
so you have many layers of paper between the windings, and that
means less room for copper. If the secondary was 1000 to 1100VAC or
so with bigger wire, you could run a full wave voltage doubler and get
a lot more watts out of that core. 73, David K3KY

>volts from a bridge rectifier, and that this would be OK for a pair of
>3-500
>tubes. With a bridge and capacitor input, you would get more like 4200

Wrong, the 3000 volts AC he measured was OPEN CIUCUIT voltage, Not, working voltage!! Under load, this may drop to 2,500 or less.

Again, this transformer WILL, produce around, (approx.), 3,000, possible 3,500 volts DC at 400 ma. , enought to power a couple of 3-500Z's at 400 ma, SSB service, for sure one (1) tube!

You can NOT make a lot of engineering calculations based on ohm meter readings on transformer windings!

Here at the KC8CAJ Amateur Radio Page we are always hard at work keeping up to date information for all our viewers. We are pleased to offer you our newest version. This new version is supposed to load extremely fast depending on your connection and net traffic.

You'll find information in the areas of Amateur Radio, Computers, DX, Shortwave, Radio and Electronics Retailers. These are just to name a few!

Here is the URL: http://www.kb8uyz.com/kc8caj

Take a look around and feel free to drop us a note! Let us know if you would like to have your page listed or of any questions you might have.

Tnx and 73's

Truer words have not been spoken. All the Helwett-Packard analyzers Iï¿½ve
ever used, 8566 swept-type through the latest FFT based Dynamic Signal
Anlayzers aand Vector Analyzers did not use any amplification ahead of
the mixer. Of course an attenuator was ahead of the mixer. HP literature
goes inot great detail on the dynamic range considerations of the mixer
and the use of any amplification ahead of it. These HP Application Notes
would be an excellent inof resource for anyone looking to build there
own SA. As far as I know, they can be obtained for free from your local
HP sales rep.

Best I can recall, none of these units have a 95 dB dynamic range (at
least at the specifed measurement accuracy specs). I dig out the books
and verify this.

997. UV PROM eraser bulb found cheap

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-27 00:00:00 UTC
From: jdc@cci.com
Message-ID: <6alnu8$hg8@bmerhc5e.bnr.ca>
Source record: 86920
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.misc

I found a source of inexpensive germicidal UV flourescent light bulbs, great for erasing PROM's. The company is "Bulb Direct" and their phone number is 800-257-0760.

A Ushio G15T8 bulb was under $14.00. (The Sylvania bulb was $37.00) They also have smaller sizes like the G8T5 for less than $9.00. My UV erasable PIC 12C509's were erased in 3 minutes.

DANGER! Do not ever look at one of these while it is running. You will fry your eyes. For info on a do-it-yourself PROM eraser project check http://www.paranoia.com/~filipg/HTML/FAQ/BODY/F_uv_EPROM.html

By the way, I have no association with Bulb Direct other than as a customer.

The full retail version of HamComm will not work under a multitasking
system either. HC needs to have direct control of the serial port to be
effective.
Another thing is that you must tune your signal to be within the
acceptable freqs. I have mine set to center on 700Hz and it works
fairly well.

OK...hold on guys! RTTY Sitor or Amtor obeys the same law: The
channel is NOT the center frequency and it will never be
the channel frequency. ITU has indicated for years that the lowest
emitted frequency shall be MARK and be considered the channel frequency.

Why hams cannot get this concept down is really difficult to understand as
the idea has been around for many years. Cliff K7RR

IIRC, the pin-out is the same -- but you'll probably want to bias the 4-400. I don't know whether the AL-80 runs the 3-500Z in true zero bias -- if so, a 4-400 won't be happy but it might be fun to watch it melt.

The 1981 ARRL Handbook shows a pair of 4-400s correctly biased. This plan is in a lot of similar-year handbooks, and might provide a good starting point for correctly biasing a single 4-400.

However, a new 3-500Z is not THAT expensive -- if it's just a matter of a soft final, I'd replace the 3-500.

1013. Heath HW-2036 to 6m FM??

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-28 00:00:00 UTC
From: wb4lnm@aol.com
Message-ID: <19980128042200.XAA21260@ladder03.news.aol.com>
Source record: 86838

I'm thinking about changing my old, venerable HW-2036 (1976!) over to 6m FM. Most of the circuitry looks workable to drop to this range, keeping the multiplication factor and such the same. The power amp may be tough, since it used printed inductors, but the rest looks straightforward.

Anyone ever heard of this being done? I'd hate to reinvent the wheel. Otherwise, looks like a nice base for an article, given the number of these still in the field. The radio is pretty useless on 2m in today's congested environment, even with the mods Heath made for the VF-7401 (I know, I worked there then!).

Thanks. 73 John... WB4LNM

1014. Plate Transformer - How Many Watts?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-28 00:00:00 UTC
From: k3ky@juno.COM
Message-ID: <19980127.235247.8638.2.k3ky@juno.com>
Source record: 86839

Jim Overstreet probably didn't measure the secondary AC voltage.
A careful reading of his list of measured parameters strongly suggests
that the 115VAC primary voltage and 3000VCT secondary voltage are
nameplate values stated by the manufacturer- notice that these two
items appear in parentheses to the left of the colons, whereas the
measured parameters appear to the right. Perhaps Jim would care to
clarify this point.
This means that the 3000 volts is the nominal secondary voltage
under load. Any larger transformer of this general type can probably
be safely assumed to have about 5% secondary voltage regulation
under load. It might run 7%, and it might even run as low as 3% or so,
but it almost certainly doesn't run 17%. Suggesting that the secondary
AC voltage drops from 3000 to around 2500 implies that the secondary
voltage regulation is 17%. It is unlikely to be *that* bad.
What is more likely is that the secondary voltage would be around
3150VCT no load, dropping to around 3000V at full rated load (whatever
that is.) This means the no load DC voltage developed across a cap-
acitor input filter would be 3150 x 1.414 = 4454 VDC at the very most.
With any capacitor leakage or any bleeder current, the actual DC volt-
age would be somewhat less. Maybe 100-200V less.
At full rated load current (whatever that is,) you would have 3000 x
1.414 = 4242 VDC max, and likely a little less. For ham radio use, the
transformer can likely be run a little harder, due to lower duty cycle.
The referenced formulae take into account the low duty cycle of
amateur SSB operation. The estimate I gave in my previous post
for full wave bridge configuration makes this assumption about duty
cycle. Such formulae most certainly *are* useful for estimates of a
transformer's capabilities, and yield surprisingly accurate results.
It certainly stretches the imagination to see that transformer
providing any more than the 200 mA or so the formula predicts for
bridge service, or perhaps 400 mA for FWCT service. You *might*
run it harder, and you might also burn it up! Let's say the secondary
voltage drops another 5% because we are drawing more than the
nameplate current (whatever it is.) Then we have 3000 x .95 =
2850VCT. 2850 x 1.414 = 4030 VDC (or less). A far cry from 3500 VDC,
let alone 3000 VDC.
It is dismaying to look at a big transformer like this and see that it's
power capabilities are so limited. But, as I pointed out, a lot of the
window area for the windings around the core is taken up by layer
after layer of insulating paper between windings. This uses up
space that could have been filled with more copper. This unit was
clearly designed for FWCT service, probably into a choke input
filter, and the nameplate rating of the overall HV power supply was
probably around 1350VDC at around 400 mA. I would have guess-

ed this from the description and the high secondary resistance, even if the plate caps for the 866A's/3B28's weren't mentioned. Note that we don't know the transformer's secondary working voltage from the description given, so we don't even know if the insulation is adequate for 4000+ VDC. Since the unit is probably old, and has been out of service for a long while, it would be prudent to give it a long bake in a low temperature oven to drive off accumulated moisture. It would probably be best to use this one in FWCT service with 572B's. It will likely last a lot longer that way. So far as 3-500 tubes, you could run one with a bridge, but this is a bit much plate voltage for them. Thus, my suggestion of running a single 4-250A or 4-400A. They like a bit more plate voltage. Though 3-500's are rated for up to 4000 volts, they are usually run with 3000 or so. They are rated for up to 400 mA plate current as an AB2 RF amplifier, so a second 3-500 would be wasted with this transformer.
Power supply design is well known to be an inexact science. After the best-informed engineering calculations, it is still always necessary to prototype a circuit design. There are many variables including the transformer parameters- winding resistances, leakage inductance, core type, etc. Nonetheless, an experienced designer can make some good estimates and end up pretty close on the first iteration. The referenced formulae which use secon-dary winding resistance to estimate output current capability are a reasonably close approximation for what a transformer might sustain on a long term basis. One design tradeoff is temperature rise vs. service life. If you want to run the daylights out of a part, you are inviting the possibility of early failure, but this may be an acceptable compromise. 73, David

1015. Another Plate Transformer Found - How Many Watts ??

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-28 00:00:00 UTC
From: k3ky@juno.COM
Message-ID: <19980128.002232.8638.3.k3ky@juno.com>
Source record: 86840

wa5dxp@worldnet.att.net (Jim Overstreet) wrote:

I was rooting in the junkpile for another plate transformer, and may
have hit "paydirt". This transformer is a little larger than the last
one but is quite a bit newer and heavier. Here are the measured
parameters:

Total Weight: Approx. 34 lbs
Primary leads appear to be #10 stranded
Lamination Dim.= 6 3/4" H x 5 5/8" w x 3.0" Thick

Total Primary Resistance = 0.7 ohms
Primary 220V with two extra voltage-adjusting taps

Secondary Total Resistance (It's CT) = 27.6 Ohms
Measured Secondary Voltages : 1740 - 1660- 1574.

This one seems to be a much heavier duty transformer, and a lot
"younger" than the other one I had inquired about. Do you think this
one would work for a pair of 3-500Z's?

* * * * * * * * * *

Jim: I think you have hit paydirt on this one. The output voltage from
a bridge would be a bit low, though, at about 2400 VDC no load, when
you run the transformer at it's highest output voltage. The formula
from AG6K's website predicts you can get 1.27 A based on the sec-
ondary resistance you measured. With spectacular voltage regula-
tion, this works out to 2400 VDC x 1.25 A = 3000w x 60% efficiency =
1800 w output. Not a bad unit.
The catch is that the low plate voltage and high plate amps mean
that your plate impedance would be around a thousand ohms or
less. This means really big values of tuning and loading capacitance
in a pi output circuit. For 80 meters you would need about 546 pF
tuning and 2274 pF loading. On 160 meters you need a whopping
1060 and 4421 pF! It's doable, but means big honkin' tuning caps
plus big padding caps.
There's one other catch- 3-500's are only rated for 400 mA plate
current per tube. Yes, I know some amps run them harder, but
that's what Eimac sez. If you run more current, the tubes won't
melt, but linearity will suffer in SSB mode. 3000 plate volts would
be a lot nicer! 73, David

[...snip very nice discussion on HP eq]

John,

Thanks for the excellent info on your equipment. We know where to come
for future questions like "how did they do it?" :)

I'm surprised at the missing filters for the first and second IF. You'd
think for a few dollars added cost they would have been part of the
design specification.

I'm still curious about the isolation needed for a tracking generator. Do
you think it can be part of the analyzer design, or does it have to be in
a separate module?

I know single-shielded coax is only good to roughly -60 to -80 db, that
double-shielded is better, and hardline is best.

Using these as a guide, do you think sufficient isolation could be
achieved with shielding and filtering, or would a tracking generator

simply have to be put in a separate box?

Hello Mr Upsetter,
I cannot imagine what type equipment you are
running that would need regulated 12V @ 40 Amps. I don't think you will
find an IC that will regulate that much current and that means designing
your own. 40 Amp circuitry can hurt you. Almost everyone who trys to design
something has a few failures while working out their designs. Certain kinds
of Lytics can belch noxious gas, emit burning hot liquids, and even explode
in your face. How do I know?? Personal experience in power supply design.
If you really want to fool around with that much current you could build a
follower for the 2 amp regulator using the venerable old 2N3055 power
transistor. You will have to parallel 5 to 10 2N3055's, depending upon the
heatsink with fan cooling. They must be matched on a curve tracer and you
should use fractional ohm power resistors on all the emitters to more
evenly balance the current sharing. I built a 30 amp 5 volt supply using
that very method. It went together rapidly and worked well. One design
trick is to use a resistor in the ground leg of the 2 amp regulator to
raise its output voltage enough to drive the base's of the 3055's. Take all
the necessary precautions to protect yourself when trying out your design.
If you really want some good advice, forget designing a high current supply
and buy a professionally designed one that has already passed testing and
is safe to use. You'll save your self a great deal of misery and avoid
injury.

My computer is a Toshiba Satellite 200CDS, and I also have problems. The older models work FB, and I can use all features, including CW keying with the two additional switching transistors needed for this to keep QSK. The older Toshibas seem to have more robust serial ports. With the new ones, I get better results when I don't use the DTR and RTS for power. Also, try increasing the value of the current limiting resistor if you use RTS for keying the PTT line in a transcieve version.

I notice on my toshibas, and I am on my third one, that a 486 machine makes for a better looking Hamcomm scope display. Same with JVFax. I have heard of utilities that slow down the computer for programs that don't run well on a fast machine, and something like that might improve the scope function, I don't know.

When the program seems to hang up, try toggling TX on and then back off. This seems to reset something on these machines.

Good luck, and I hope this helps

Hi All,

Question regarding small signal paramters - h-parameters etc,
these are only valid for small signals correct ?

When designing power amplifiers what techniques do you use then ?
as far as matching impedances and ensuring a good frequency response.

Is there anyone who knows where I can find info (web or otherwise)
on the design steps for building transistor ampilfiers.

cheers.

atts.

some good acvice snipped.
You already read that, so here is mine.

A 12 V regulator chip, a darlington pair to drive a half-doz
2N3055 on a good heat sink w/fan, and you are on the way.

Look in teh ARRL handbooks, where I have found a lot of
good stuff on the subject.

Good luck
Be careful.

I don't see any real reason why it (the generator) couldn't be in the same box. You'd definitely want to use a good coax grade internally (everybody uses hardline, it seems), and a well-shielded BNC terminator for the front-panel jack when not in use.

I think the reason for the lack of notch filters for the IFs is that instead of IF feedthrough, you'd have a "deaf" spot, which would be worse.

You are blameing the wrong people. The code requirement came from the ARRL pushing the FCC. It was a long time ago and most of the magazines at the time, other than QST, were warning Hams about this. I believe they still are keeping things , read advising, as they are. Back then Tech's had all frequencies with no restrictions. With only 1% (I think I am being generous) of Hams building anything any more I wonder at keeping the present restrictions. Yes I understand those who have mastered the code and right should be respected for keeping the traditions of the hobby. But It might be better to have other knowledge or time in grade be the gateway to operate on HF.

Ive come a bit late to this but I wonder if it would be possible to construct a cavity resonator with mechanical tuning and high Q to use as a mechanically swept filter followed by an amp/detector. Perhaps part of the swept volume of the cavity could include dust iron core to extend the lower frequency range.

Thanks for this info. As a guy who takes a tightwad's approach to building, I appreciate it.

I knew the germicical bulbs lacked UV filtering, but didn't know where to get one. I've tried bub-zapper bulbs; didn't work well at all. I've also set my EPROMs up on top of a blacklight bulb in my daughter's room--works fair but takes a few hours.

VHF DX'er often seem to prefer using transverters since VHF
transceivers may have low dynamic range and few facilities for DX'ing.
I use FT-902DM with transverters for 6m/2m/70cm/23cm and IC202 for
13/6/3cm SSB/CW.

Surplus. I bought an old 86230B for one. I got a couple
of more from ï¿½cooldaveï¿½ but they have shielding missing.
Scary but for $25 each I will hope not to go too wrong.

ï¿½ into the PCI bus to work on it?

I was thinking of the AD9058. No over sampling here.
So far it is just a thought. The idea is to use a log RF
output into the ADC so you could get lots of dynamic
range with only 8 bits. But the AD606 doesnï¿½t have
an RF output, just a limiting output.

>
>

ï¿½ and keep it in a narrow IF. Any ideas?

Even with my hp8558/8444 you have to constantly adjust the
trim when the bandwidth is narrow. With a microprocessor
to help, this might be overcome.

With the analyzer I built in ï¿½86 I am still very surprised
at how clean it was. I could very slightly see the 32Mhz
log IF and that was when I tried. Otherwise, there were
no other spurs.

> 1) You want to avoid spurs in the design stage, not just by throwing
> shielding at the problem. :-)

> automated tests, save and print traces, etc. Life is too short not to
ï¿½ use off-the-shelf components whenever possible.

Yes and ideally the analyzer processor would be done on
one (or more) board and then you could go to a PC or
use it in a self contained analyzer.
>

>I'm still curious about the isolation needed for a tracking generator. Do
>you think it can be part of the analyzer design, or does it have to be in
>a separate module?

The only trouble with single conversion is the LO will
be the first IF frequency of the spectrum analyzer. In the

hp 8444 this is remedied by doing two conversions.
It is about impossible to keep a single conversion LO from
feeding through. Otherwise it should be no trouble including
a tracking generator. It is almost becoming a standard
feature of a spectrum analyzer.

FRANK VAN VLOTEN wrote:

Dan,

When you've finished your move, you may like to consider using the
new AD8307, which is probably a lot cheaper (even for you in the
U.S.) than the AD606. Its quoted input frequency is 500MHz, higher if
you read their very interesting application note that goes with the
specs, and dynamic range quoted is 92dB for +-0.4dB linearity
deviation. Nice to be able to talk about 141Ts and so on, but here at
the bottom end of Africa you roll your own, which is exactly what I'm
doing, with a long persistence CRT for slow scan narrow bandwidth
applications, and all that goes with it.

Dan wrote:

I have down loaded the datasheet for this product and I am impressed
at the cost/performance. I have already jigged and tested the AD606
but it looks like I will have to do the same for the AD8307.

I am following this thread but we are in the middle of a move so
I may be scarce now and then.

Best, Dan.

True, true, and true.

>Back then
>Tech's had all frequencies with no restrictions.

False. Techs had fewer privileges then than they do today, only
part of 2m and no HF at all (which Tech Plus does have) for example,
and had to pass a 5 WPM Morse test as well as the full General written
test. Today's Tech has the most privileges a Tech ever had. That is
no thanks to the ARRL, of course. They opposed the current Tech
license.

Hi Will OM,

I would not believe the advertising claims, but the small loop can be
an effective antenna, if well constructed homebrew style. Make it as
big
as you can, not just 3 ft diameter like the commercial ones (they do
it for easy shipment). Braze or solder ALL RF connections.
There have been many published articles. A search on magnetic
antennas yields the following site, which is a good one:

http://ourworld.compuserve.com/homepages/csl/mlmaths.htm

There are others.

>Best, Dan.
Whilst you're looking at AD8306,check also the AD8309 -it also
has 95 dB dynamic range but over -75dBm to +20dBm.
They're similar devices -the 8309 uses10 stages of successive
detection versus 7 stages for the 8306.
The log accuracy spec is better with the 8306 if you're looking for
precision measurements.
AD8306/8309 should be priced around $9 to $10 in small
quantities.
The AD606 was designed for ultrasound & for RSSI usage in
communications systems (digital cellular base stations).

Hope this helps a little..
Chris Muriel (G3ZDM).

I'm a poor man, into HF/Lo VHF spectrum analysis, and I found the answer to be the Singer SSB-50 ALFRED RF Spectrum Analyzer. It's early-'70s, cost US$60.00, works like a dream. It's used in conjunction with 2 xcvrs, 1 has 500 Khz IF out, the other 30 Mhz IF out.

There's just one thing I've wondered about, though. What the hell does ALFRED stand for?

Why hams cannot get this concept down is
>really difficult to understand as
the idea has been around for many years.
>Cliff K7RR

That's right, Cliff. Take a look at "Admiralty List of Signals" or any other official reference to coast or other commercial stations. Tune up a station, add your USB tuned frequency with the tone audio frequencies to get the true RF frequencies of the tones, and you will find that the freq you get for MARK is in fact the published frequency.

That most hams are not aware of exactly how this works is quite understandable since we usually just rock the tuning knob till we find a CQ, tune on him, and answer simplex. The actual frequency is only important in that the recieved audio tones must make it through the IF and Audio filtering. I was taught that Mark should have an audio tone of 2125 Hz, and so I set up everything to tune accordingly, but it really doesn't matter, since the shift doesn't change with frequency and the carrier is not transmitted.

To set up a sked or to QSY, both ops should just compare their tuned frequencies so any offset between them can be adjusted for. Establishing a protocol for ensuring that two stations have exactly the same numbers on the readout is problematic since there are often hardware constraints that determine where the tones must appear in the baseband.

The phase DETECTOR in the 4046 is actually rather good, but the VCO, being
an R-C multivibrator sucks compared to an L-C VCO ...

> with a file!

Yup, I once used a 4046 VCO in a PLL. It doesn't operate that high as
far as RF goes, I recall I used it around 1MHz, and it was very
phase noisy. Increasing the loop bandwidth did seem to reduce the
VCO noise but the reference sidebands became *quite* strong.

There are newer variants, like the Philips 74HC4046 and 'HC9046,
where the VCO will tune to something like 30MHz, but I don't have
any reason to believe they're any quieter.

I also tried a (fairly uncommon today) MC4044; it was better than
a 4046 (and tuned higher) but still quite noisy.

> >Anyone used this in a radio?
>
> I think you would be better off going to an LC-varicap VCO!

Oh, heavens, yes. Even a bad LC VCO will almost certainly be better
than a 4046 in terms of noise, though getting consistent tuning linearity
is a challenge ;-).

GE MASTR II VHF mobiles with the PLL exciter option.
Currently set up on 15X.XXX, but will easily move down below 150MHz.
65W and 40W.Several of them also have UHS front ends (pre-amp).
Speaker, mic, cable, head comes with each unit. Radios will be bench
tested for functionality prior to shipping. Some regard the MASTR II
as the ultimate radio for repeater conversions. Conversion instructions
available. If intersted, please send e-mail to: GWORTH@IBM.NET and also
copy ADCJR@AOL.COM (be sure to copy both, as one of us is frequently
out of town). $75, Postal Money Orders, + shipping. Thanks for your time.

For linear, hard to beat the good old 723 regulator IC. For the pass
transistors, I prefer the 2N3771 or 2N5302 to 3055s....

wa5dxp@worldnet.att.net (Jim Overstreet) wrote:

If I used the 1574V taps, and using Measures approximations, this would yield 3900V at 500+ ma. If this is so, what values would the Pi Network plate and tuning work out to be if 160M was included in the calculation? I think those formulas are in the handbook somewhere.

Also, since the transformer is Center Tapped, how about using only half of the secondary for CW/RTTY? I think it should be sqr of 2 or .707 x full plate voltage, but since the Center Tap is all I have now, do you think that would work? Would Pi network parameters stay close to the SSB values?

I have a 300 pf and a 500 pf vacuum variable from the junkpile and some large multi-section receiving variables for the loading. I also found 2.5 Mh multi-pi wound 700 ma Millen choke, would that be OK for the plate choke? I've been scrounging for years gathering parts, now it's time to start building.

* * * * * * * * * *

Glad you found the Measures website, Jim. I have found it most helpful for my work with amplifiers and power supplies.
There is a really neat dual-voltage HV power supply circuit on that website- it is Figure 3. The circuit uses a given secondary voltage and switches between full wave bridge and full wave voltage doubler configurations, so you get 'full voltage' with the doubler and 'half voltage'
with the bridge. Be sure to use a husky, well insulated switch, and only operate the switch when the power supply is turned off. The dual-voltage circuit is intended to reduce plate voltage for RTTY, for example, just as you mentioned.
I see you did the calculations for the FW doubler. Yes, you can use the lowest 1574 V setting and a doubler to get 2 x 1.414 = 2.82 peak VDC. His approximation is 2.5x, which is a realistic full load value, and I see
you used 2.5x to come up with about 3900V. So far as the values in a pi net, you would have a plate load impedance of 3900 ohms at 500 mA plate current. This leads to tune and load cap values of about 136 and 820 pF for 80 meters, and 265 and 1594 for 160m. My source, by the way, is Bill Orr, W6SAI, writing in Ham Radio Magazine, July 1979, pages 34-39.
With nearly 4000 plate volts, you are in big trouble on 20 meters and up. Plate tuning capacitance for these bands are: (20) 34 pF, (15) 23 pF, (10)
17 pF. This is getting too low even with your vacuum variable caps and

their low minimum capacitance. There is a good reason why all band HF amps with 3-500Z's usually run closer to 3 kV, and this is it. (There are several other good reasons, as well.)
It turns out your transformer has output voltages more suited for making 4 kV than 3 kV. There are a few little tricks that might save the day. There is always a 220V variac option. This will hurt overall regulation, but may not be a problem. A less often seen trick is to get a *big* low voltage transformer with a really heavy secondary winding and run it voltage-bucking in the primary of the big plate transformer. I will write more about this if you are interested.
I like the idea of doing some switching in both primary *and* secondary with this particular transformer. For SSB and maybe CW, you could use the 1574 V configuration into a FW doubler, but with the primary voltage bucking to pull the HV down to 3500 V or less. For RTTY you could switch the secondary to FW bridge configuration and lose the primary bucking transformer *and* change the primary tap for 1740 V configuration. Then you get somewhere around 2400 V idling and maybe 2200 V (?) or so full load. That should be near ideal. My Drake L7 runs about 2700 for SSB and 1900 for CW/Tune. That is very conservative, though, and many amps run more. I don't get anywhere near 1500w out, but my tubes have a hopefully longer life. Tradeoffs! One catch here- you need to do the calculations to see if you can pick plate voltage/plate current pairs that yield about the same plate load impedance. That way, the pi network will work with little retuning on every band when you change the plate voltage. Any other arrangement would be a real nuisance!
Finally, that 2.5 mH choke sounds real nice for a 160m amp, and maybe even for a 160/80, but I can almost guarantee it will self-destruct on one or more of the higher bands. It is bound to have many HF resonances. If you want band switching and 6 to 9 HF bands from 160 to 10 meters, this is definitely not the way to go! Save it for a 160m monoband amp. You will still need to check it very carefully with a grid dip meter for resonances before using it on *any* band. Will be glad to supply some literature references on that subject if you have more questions about plate RF chokes.
Oh, yes- you could do switching between full and half secondary. This is another way to go instead of the dual-voltage rectifier circuit. Half of 1740 VCT gets you about 2200 VDC with a doubler. Then changing primary taps and switching in primary bucking could get you 3500 VDC from the 1574 configuration. Just remember we're talking really well insulated, husky switches, here, and the ones that switch the secondary around have to withstand high voltage. They're not commonly available, but can be found. I don't like the idea of using only half of the secondary. You can't run too much more current. The current rating of the wire is always the same. But you are settling for half the winding voltage, and that is only half of the total available transformer VA rating, ignoring any playing around with duty cycle that you might be tempted to do. I think the dual-voltage circuit is much better here.

Well, back in the NAV, we used FRED as an acronym. The RED stood for Ridiculous Electronic Device. The letter "F" had the usual Naval meaning. The computer at "Beep" school was called FRED, as a mattter of fact. If you can think of what A and L might have stood for, we might have a plausible guess by putting it all together.

Presumably it's OK to use Uo = 4 pi x 10^-7 H per metre, and Urod is
around 12 (down to say 6 if approx half the rod's length is wound)?

I'm not worried about 3rd figure onwards because things always need
trimming anyway.

Just one detail worth mentioning: an excellent valve for a transmitter
at this frequency is the triode 2C39 and its equivalents. It has a max
dissipation of 100W with forced air cooling at an anode voltage of
only 1000V. Must be used in grounded-grid mode and is suitable for
both a coaxial and a slab line type of anodecircuits. It should work
up to 2500Mhz with full input.

Best regards,

Arnold Goks&#65533;yr

You get a few things with it - CRT display, 500 Khz calibrator, two-tone calibrator, amazing resolution and frequency response, and it runs off 115/230V 48 -1000 hz. The manual has pages and pages of REALLY INTERESTING schematics.

The best part of all - you just plug it in and use it.

Hi,

Where can I find spec of AD8306, AD8309?
What's the band name?

On Wed, 28 Jan 1998 20:06:11 GMT, (Chris Muriel) wrote:

Hi there,

is there anyone out there who can supply me with either a schematic or a solution to reprogramm a almost dead prc-68b??

got mine from a fleamarket and it seemed to work alright.
after some serious testing the fault showed up in the upper band from 51Mhz onwards.No output and no receive.No oscilltion....

i figured out, that some code in the eeprom might be missing, therefore i need to reprogramm the unit.Also the unit hangs on some positions of the channelswitch.As it won't accept any changes in frequency.

Hope someone can help me...
If you have anything,pls

mailto:AVICOM@T-Online.de

thanks,

Holger

Barry,
I can tell you that it works in a Heathkit sb220. I have used a pair of them in the unit. The 4-400 is slightly taller then a 3-500z, so watch out for the top of the plate.
Additionally you need to hook the screen grid to the grid of the tube so that it becomes a triode. I used Amperex and chose the grid because the screen was closer to it and I wanted to keep the breakdown voltage as high as possible.
The 4-400s that I used cost 10 dollars and were used. As such on 10 meters I can only get about 450 watts out. 160 was about 800.
Thats about it.

Hi all,
This may not be the exact correct newsgroup for the question,
but hams are hip to such things. When will the 100khz loran system
cease to be supported. With GPS, the death of loran seems certain.
Has anyone heard any information on this? I sail an armstrong
vessel (viking longship) and i have the loran on board. Will buy
a GPS someday, but till then.

If you terminate a line of, say, 45 electrical degrees in an impedance other than its characteristic impedance, the magnitude of the ratio of the current out of the line to the input of the line won't be 1, and the phase angle won't be 45 degrees. The magnitude transformation can be large, and the phase angle can be much different from 45 degrees. In most phased arrays, the load (element feedpoint) impedance is quite different from 50 ohms. Even if one of the elements by itself is adjusted to 50 ohms, once the whole array is excited, the element impedances change due to mutual coupling. So in general, the phase delay in a "phasing" line isn't equal to its electrical length.

If you know the impedances of the elements when they're being driven, you can sometimes calculate feedline lengths which will give you the right current magnitude and phase ratio. But except in some special cases (like two elements fed in phase or 180 degrees out of phase), the difference between the line lengths usually won't equal the phase difference. This method is presented in more detail in "The Simplest Phased Array Feed System -- That Works" in the ARRL Antenna Compendium, Vol. 1. For more information about the phenomenon of the phase shift not equalling the electrical length of the line, see Chapter 8 of the ARRL Antenna Book.

Roy Lewallen, W7EL

1086. Re: Phasing harness question

Oh, one more note. A couple of the example programs that come with EZNEC illustrate the feed method in the Compendium article. The results from EZNEC and from the article agree very closely. One EZNEC example is a 90-degree phased antenna which has feedlines differing by 74 degrees. The other is a 4-square, where two lines differing by 142 degrees are used to get a 90-degree phase shift between pairs of elements. Similar examples appear in the Compendium article.

Hi all,

Thanks for the excellent suggestions - I just wanted to let you know my ISP has installed new software and changed to some kind of new connection to Bell Canada - all the newsgroups are hosed and I may be off the thread for a while.

But it looks like there are some very good ideas - please keep it up and I'll catch you later in Deja News :)

Best Regards,

Mike

You can download any Analog Devices data sheets by what they call
"Fax-on-Demand". An automated 24 hour a day delivery service. Simply call
1-800-446-6212, and answer by touch-tone the quextions asked. In a few seconds
after hanging up, the Fax will be delivered to the phone number you specify.

Who knows. The fishermen here on the gulf coast still make use of Loran C. Loran C has greater REPEATABLE accuracy than the standard GPS signal. This is assuming use of TDs for pecsise navigation excercises involving avoiding a previously encountered hang, etc. The Lat/Long readout of a Loran C set will often by flawed by a hundred meters or more, but when your TD readout says you are over a previously marked waypoint, if it is identifiable by chromascope or fathometer or structure, guess what... you are THERE. This sort of application is more accurate (by a very slight margin) than GPS. The Lat/Long readout of a Loran C set is nowhere near as accurate as GPS, since being a terrestrial system relying on groundwave propogation there are surface effects that skew the signal. These effects are constant, which is why you can return to a previously recorded position so accurately even though your Lat/Long figure is flawed. Loan C might be around for quite a few more years.

The system that is most likely to fall by the wayside is SATNAV, since the GPS system was really intended to replace it and not LORAN. SATNAV relies heavily on DR for position updates between satellite fixes, and works best when interfaced with another navigation system such as LORAN, Inertial systems, etc.

What surprises me is that the OMEGA system is still operational. OMEGA is not a bad system, except like so many systems including Celestial, you have to know where you are to find out where you're at. If you don't know what "lane" you are in, you will have an ambiguous position. Almost like if you didn't know what side of a LORAN baseline extension you were on, but you have 50 choices instead of just two. Somebody's brother-in-law must have some contracts on the OMEGA thing. Anyway, SATNAV will definitely fall by the wayside as the birds quit working. That's my prediction. GPS is far superior in that you have constant fixes and need not rely on DR.

LORAN? I would almost bet it is around when I am not. Meanwhile, do get a GPS receiver so you have redundancy, and for if/when you leave an area covered by LORAN. LORAN skywave positions are tricky and sometimes inaccurate. Also, most modern machines do not allow the use of the stronger 4th pulse, and only compare the more accurate 3rd pulse. The control for this was the old +/- 10 microsecond button of the original machines.

GPS units are getting pretty cheap. some have broken the $200 mark. Don't let cost stop you from implementing a really nice, no-brainer, reasonably dependable nav system that is great when the stuff hits the blower and you need a fix you can rely on NOW. Most systems have all kinds of goodies like both Rhumb line and GC routes, programmable routes/waypoints, set/drift, all kinds of stuff. on a small boat (my ship is 49000 tons) you can bring up the appropriate display and tell your relief to just follow the arrow on screen. Garmin is the maker that comes to mind, but there are others worth considering.

Many have a built-in NMEA to PC interface that simplifies PC nav and planning. There are even raster-scan radars that put your GPS's waypoints on screen, and that can give you a lat-long directly from the screen of an acquired target. The most up-to-date bells and whistles are probably being neglected in LORAN C receivers, but are found in almost all mid-range GPS sets. Get a GPS, especially if you will be making any ocean crossings. When you can't get a celestial fix for a couple of days, you really will appreciate it.

Ah, embarrassment.
They're not fully production released yet (I just checked our
external website which is www.analog.com).
You could try calling 1-800-ANALOGD or 1-781-937-1428
& asking for prelim data for a start.

And someone has done the A/D interface to PC and adquisition program yet?

I'm sure this analizer will be more powerfull and nice to use with
a computer display and plenty of storage.

If there is some info about this I'm interested that someone point me
in the right direction, before buit my own from scratch.

>I had a hell of a time with Analog Devices about this this morning. The
problem stems from the fact that somebody here is Dyslexic. The correct numbers
for these devices is 8036 and 8039. Both are preliminary, the 8036 is available
from their Fax on Demand service, Phone number 800-446-6212. The Faxcode for it
is 1836.

The part number 8039 is not yet on the Fax-on-demand but can be obtained from
central applications, phone number 781-937-1428.

Very interesting chip, does 15 dB better than my AD640's, and is 20 percent of
the price.

My turn to be embarrased. There is a typo (LARGE PRINT!) in the Analog Devices data sheet for the 8306. The correct numbers are indeed 8306 and 8309, the dyslexia is apparently on the part of AD!
The rest is correct including phone numbers of AD support for data sheets.

I have several 120V AC series wound electric appliance type motors.Looks like about 1/2 hp rating. They will run on DC just as well, and will run at slower speed on only 12 volts. These are unused (with some surface rust), has a 1-3/4" long shaft that is 5/16" dia for the first 1/2", turned down to 9/32" the rest of the way and has a 1/4" long 1/4-20
threaded shaft at other end. Open frame style. $6 each plus UPS (2 lbs). Email or call 334-347-5281. NOTE: Please REMOVE the "nospam" to reply.

1099. Minicircuits VFO for 6 Meters - info needed.

I visited the Minicircuits web site for info about their Balanced Mixers. Whilst there I downloaded some information, in Acrobat PDF format, about their range of Voltage Controlled VFOs. Unfortunatly I cannot read the fine print. What I need to know is if it is possible to use one of these beasts to tune from 50-52 Mhz so that I can use it for my KK7B tranceiver project. Any comments from someone who has done this would be greatfully received. Failing that info on a stable VFO to cover the band would be of interest. Thanks

Well, my poor man's spectrum analyzer works like this:

I have a Kenwood TS570D controlled by a PC, I sweep the VFO (using commands sent from a VB program). As the VFO moves, I read the S meter reading from the radio using the program and plot a histogram of the signal strength vs. frequency.

It is farily slow because the Kenwood's VFO doesn't sweep really fast, but it works -- mostly a novelty, I'm afraid.

From: Joshua Rozovsky <JoshuaRozovsky@gwsinc.com>
Message-ID: <6ato6l$5f5$1@newstand01.iconnet.net>
Source record: 86827

Are there any high-altitude ham ballooning groups in Virgnia, more specifically in the Richmond area. If not, what is the best way to get started. We already are thinking of a very simple design (beacon and antenna in laminated styrofoam beer cooler powered by 15 volts of lithiums with radar reflector, parachute and MAX 800-gram balloon) and for added ease of recovery an altitude-triggered balloon-popping device so that the first time around we can purely practice.
Any suggestions?

Thanks for the confident support Robinson. I have been rather insistent
with my views on this. Let me repeat that "Mark is to be the lowest
emitted frequency" for the simple reason that this eliminates both the
shift being used at the moment AND the audio tone that is used when AFSK
is employed. It is the only easy way to get on a given frequency.

It would cover the frequency range you need without any problems
except that as a VFO it would not be stable enough. It is a VCO,
designed to be stabilized in a phase locked loop. It is hard to find
VCO's for frequencies in that range. I recently used this part in a
high resolution synthesizer for 55 to 85MHz.

1117. QRP transceiver recommendation?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-31 00:00:00 UTC
From: kenk@primenet.com
Message-ID: <6avnr4$61@nntp02.primenet.com>
Source record: 86693

I have the ARRL "QRP Power" and the "W1FB's QRP Notebook". Can anyone recommend any of the QRP transcievers in either? I'd prefer 30M. If not, other suggestions - preferably something in an in-print book or some other source of a schematic, parts list, and assembly notes? It can be very difficult to find a copy of a magazine back-issue.

TIA.

Ken

1118. Re: GE Superradio PCB layout

Newsgroup: rec.radio.amateur.homebrew

Source record: 86694

If you don't already know about it, you might want to check out
rec.radio.shortwave, where there is often discussion of the Superradio,
and definitely people who do know about it.

Someone was asking this question a month or so ago. I can't remember if
they got an answer or not.

There is also a readlly good FAQ about the radio, though I'm not sure
about this information you seek, at
Linkname: The GE SuperRadio FAQ
Filename: http://www1.shore.net/~dmoisan/faqs/superradio/gesr_faq.html

Hello,

I have been away from home brewing to long and much of my reference
material is way out of date. Do any of the semiconductor manufacturers
maintain online parts/device interchange guides? If so would someone
recommend some urls?, my searches haven't proven fruitful.

Doug,

Most of the semi mfgrs have websites with search engines and downloadable
(Adobe .pdf format) datasheets/app notes. You will need Adobe's (free)
Acrobat reader software, available from many of the websites you're looking
for or from http://www.adobe.com/prodindex/acrobat/readstep.html ...

I will e-mail you an html file with LOTs of links to semi mfgr web sites.
You can use this file as local file on your hard disk as a single "bookmark
URL"
which will give you links to all of the websites contained therein ...

73,

1122. Radio Control Programs....bad stuff?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-01-31 00:00:00 UTC
From: kvenl@dds.nl
Message-ID: <34d408ce.3040561@news.euro.net>
Source record: 86698
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.shortwave,rec.radio.amateur.equipment

Hi there!

Well, I tried a lot of these so called 'rig control' programs BUT:
I was amazed how BAD they really are:
- inaccurate
- user unfriendly
- just 'bugging' around (full of bad bugs)

I tried (on my NRD535D):
- ScanCat Gold for windows (Is this program really ment for ease up tuning ....? Don't got it to work very good, and it locks up the serail port for other programs (after quitting it).
- RCON v2 is VERY BAD: full of bugs (BWC simply is sh*t); cannot expand the screen to max-size, just gets back to org size;refuses to read it's own dB; doesn't work with Klingenfuss 1996; levers just disappear; no possibilties for offset setting. Really DOESN'T support the NRD at all! Left out some main features
- Freq Manager 2.0 (Can someone please test programs on their quality there?? It's very inaccurate!) Full of misspelled words. CAT (the tuning itself) just doesn't work. But a great database!!!!!! Most features left out (BWS, ECSS etc)

- NRD6.2 The only positive thing I found (and started with) is NRD6.2 from Tom Whiteside... The only disadvantage is that the databases are limited to 7000 records each. So you have to chop the stuff up. And it's DOS based, but ok, who cares after all the other programs.

-Turbo 53x : And a fairly good program is that of Jan Arkesteyn: Turbo53x.Zip
It runs well under both windows, but the databases are somewhat limited...The conversion procedures with it are simply inhuman .... Im gonna see if there's something to do about it....Still I guess this program has the best perspectives for the windows-based users

The LAST TWO are the best for the NRD5x5 to my opion, and THEY ARE FREE!!!!
So, if you have a NRD, don't bother to buy any of these programs, but go for the free stuff.

Are there other programs out there that support the NRD535 or others good and do what they say???

Im curious to your experiences...

Thanks a lot

Kees van Engelen

Hi
I have a phase angle question about 3 phase AC power.

A symmetrical setup for 3 lines would be one AC line,
with a 2nd line lagging by 120 degrees, and the 3rd lagging the first by
240 degrees.

Another approach is the 1 line, with the second line 60 degrees behind,
and the 3rd line 120 degrees behind the first.
I saw something that sounds like this is what actually is done in the
US.
Am I right???

Thanks, Neal

I have two dozen Foster lightweight commercial quality communications headsets for sale. The first batch of headsets soldout quickly and I was able to get more but at a slightly higher price (which is still a bargain). Each headset is fully adjustable with one foam padded earpiece/speaker and articulated electret mic. The connecting cable is three feet long with a standard 4-pin mic plug with index notch on the end. Included instruction sheet show 2 interface circuit diagrams for use with Kenwood, Yaesu, Icom and Radioshack radios. $7 each (plus $3 shipping) or 2 for $11 (plus $4 shipping) prepaid. E-mail me with questions or to get my address to send your order.

Thanks,
Scott Adams

Kenwood TS-930S-AT
Fox-Tango 2.1 KHz SSB and 500 Hz CW sharp skirt filters
Excellent condition inside and out
Serial #4100395

I've owned this rig since the early 80's and am the second owner. It's been the second station in my shack since '91.

The rig has always had an aux 60 cfm whisper fan on it and I attribute the outstanding reliability to the extra fan - it's never failed on me, beyond light bulbs.

The rig comes with service manual, factory service bulletin sheets, cables I made to suit my station, many mod sheets from various sources some installed some not.

The original clacker amp keying relay is replaced with a nice quiet solid state switch I designed and installed in the original space, been running for years. It will cold-switch your QSK amp.

My revised station is a 2 rig computer controlled single op contest/dx station. I'm selling this great rig because unfortunately the 930 is not compatible with this setup.

$850.

[what happened to all the other newsgroups this thread was posted to???]

But the point here is that if you're working off a list of loggings or
from a regulatory agency, trying to monitor the few readable FSK signal
left, you can't rely on it listing the mark frequency.

1. A regulatory agency (FCC, ITU) is interested in spectrum occupation
and would be interested in the center frequency and bandwidth.

2. Operating lists would use the frequency that is easy to measure,
the mark frequency.

3. Loggings from a SWL, are at best, accurate to "somewhere around here".

Kees van Engelen

The Netherlands

Well, Kees, that depends on the center frequency of your filtering. Understand that the published frequency for a station is usually the MARK frequency and not it's center frequency, and the carrier is not present. That means, barring limitations imposed by the passband of your receiver or demodulator, you can use whatever audio center frequency you like.

If you use LSB reception, which was the default at one time, the MARK was at 2125 HZ for normal RTTY mode and standard equipment. So, the carrier frequency, i.e. the frequency that should appear in the display of your modern receiver in LSB mode, is 2125 Hz more than the published freq. With 170 HZ shift, the center frequency would be 2210 Hz audio at that tuned frequency.

The problem with this simplistic approach is that the signal must make it through the filtering of your station. If you use for instance a 500 HZ filter for RX that has a center freq of 750 Hz, you need to use something pretty close to this for Center freq, obviously. You would therefore figure the actual frequency midway between the mark and space, which is published frequency - 1/2 the shift. Then add 750 Hz to that, and that is where you should set the frequency of your receiver, any you can now use 750 Hz as the audio center frequency for decoding.

I hate to complicate things even more, but If you use a CW Transciever in CW mode, the picture changes some more. Re-post or e-mail me if you will be doing this and are not sure how to figure it out. Also, in USB, the relationship between MARK and SPACE frequency is reversed.

As long as you know what offset to use when tuning for a particular station at the chosen center frequency, and as long as the audio will pass cleanly through any filtering, use whatever center frequency you like. It just doesn't matter.

TIA.

Ken

W1FB's QRP Notebook has a lot of nice and simple building blocks like antenna tuner, QSK TR switching, power supply, Crystal filters, Sideband exciters including a very simple design suitable for QRP, and lots of design tips. No complete transciever project there, but a couple of receivers and transmitters that are pretty simple tu build and get running.

QRP CLASSICS is another ARRL book I like. It is a compilation of articles from QST, QEX, and the Handbook. There is a wealth of info on a lot of qrp related topics.

Sadly, these books are pretty short on practical superhet transcievers. Direct conversion would be FB on an underutilized band like 17 meters, but images will be a problem on 30, your band of choice. If you have some building experience, might I suggest a simple single conversion superhet? It would be nice to have single-signal reception on that band, as some of thecommercial stations there are pretty strong.

Phasing type image cancelling receivers would work too, though alignment is somewhat more complex than getting regular DC recievers up and running. The nice thing is, though, the same oscillator can be then used for the transmit side, by adding a capacitor to the occillator and switching it in and out for the offset. This type of receiver in itself is not much simpler than direct conversion, but at least it makes the transmit side simpler.

QRP CLASSICS has a nice looking 20 meter SSB/CW Superhet transciever, but the added complexities of SSB are of no use on 30. It is the only Superhet Transciever project presented in either book.

Don't be afraid to cobble something together out of standard building-blocks. Do be careful about AGC, though, if you use it. The AGC voltages could be high or low going, and the levels may not be compatible with your IF amp, so if you use it, and I usually do not with modular design, be careful you aren't trying to match apples and oranges.

If you are new to homebrewing, you might want to start with a simple 2 stage crystal controlled transmitter and use "armstrong" TR switching with an existing receiver. My first station was set up this way. Then when you have that percolating, build a matching receiver, and gradually interface it with the transmiter. It will indeed take a lot longer than building it "right" the first time, but I like taking things a bite at a time. Parts count will be a bit higher with this approach, since nothing will be shared but the power supply, but it makes understanding what is going on and troubleshooting a little easier.

Yeah, I missed that. I wasn't aware from an operational standpoint because I haven't seen an OMEGA receiver in use in probably 5 or 6 years. Everybody on the high seas just about has GPS these days, and most ships also have SATNAV which is still a quite usable backup. Last I looked, there were still OMEGA questions in the USCG question pools, though, which is why I made the incorrect assumption that the system was still up.

Try Philips TDA8708. It's cheap, goes up to 30MHz and has built-in variable
gain amplifier for AGC. It's noisy, but if you're doing TV video, you won't
notice.

looking at the positive peak as a referance phase 1 is at 0 deg
phase 2 at 120 and phase 3 at 240. its it, and thats that.

220v 3phase is usually delta wired, as compared to 208, which
is normally wye wired. both can provide 110v exactly.

>n2kpk@aol.com

Hi,

as long as you don't want to measure RF voltages below, say, 10 mV or so and you don't need a high impedance input a simple one diode rectifier works fine. As the output DC voltage does not depend linearly on the RF input voltage you do need a diagram to "decode" the reading. The reading is also temperature dependent, but this only a real problem if you want to measure smaller RF voltages.

The 1SS99 diode (Toshiba?) works fine in such circuits (fmax > 1 GHz) and gives a large DC output as well. The BAT 63 and BAT 65 diodes and the MA4E2054 diode series (made by M/A-Com Inc.) would also be a good choice.

There are more complicated circuits giving a direct and temperature independent reading as well. Have a look at Horowitz & Hill: The Art of Electronics for instance. I am building a rectifier based on the amplitude-tracking scheme mentioned in this book at the moment.

Burr Brown has published an active RF rectifier circuit in its OPA660 data sheet. It seems to me that this circuit is suited for lower frequencies (SW?) only.

No, both "Y" and "Delta" are phased 120 degrees between phases. You're describing what would be half of a 6 phase system however. There's plenty of that in use industrially, but is provided by chopper systems not by the power company.

Got a quick question....

In my jeep i have a cb and my kenwood tm-v7a. The cb is a K40 unit. Just to set the cb part straight, the reason i have it is because on many off-roading trail runs i do, it is required.

The V7A has a 8 conductor wire in an RJ45 jack for its connector for the microphone. I can buy an RJ45 to 8-Din converter for the mic, which I guess would help. I need to be able to use the Kenwood mic for both the V7A and the CB and have a switch for it.

Any ideas?

Thanks,

CJ - KF4CAG

There are zillions out there. Key things to watch for include whether you want LED or LCD display, how many digits, power consumption, board size, and IF offset requirements.

Just for kicks I made one a while back with a couple of 74HC4040 ripple counters, a microcontroller and an LCD display (the usual sort, with a Hitachi 44780 controller). It works just fine...

I recommend the H.P. 33120A function generator / waveform
synthesizer. Goes DC to 15MHz, with 16,000 point arbitrary
waveform storage (12 bits 40MS/s). Has RS-232 and HP-IB /
IEEE-488 interfaces. Opt 106, BenchLink/Arb software.
About $2100 total, totally cool.

More than 12 bits? Up to 6MHz or higher? Hmmm.
Build it yourself or workaround time? ...

>
> Is the schematic posted anywhere, Laura?

'fraid not: I did it as a one-off hack. I was trying out some
ideas to do with LCD programming and frequency offsets.

The actual hardware was a touch more complicated than that.
It used two 74HC4040 counters and two 74HC165 parallel-in
serial-out shift registers to provide a serial input to the
controller, and a 74HC00 as the input gate. The controller
zeroed the counters, opened and closed the count gate, loaded
the shift registers and clocked in the proceeds, and then
talked to the LCD in 4 bit mode. Physically a little more
complicated than many of the counters out there (especially
those that use the timer/count registers many microcontrollers
have these days), but dirt cheap (especially after stocking up
on cheap LCDs at the local surplus store), and endlessly
flexible. It might actually be worth refining some day.

The key idea was that given a 16 bit binary count, the simplest
algorithm to convert it to decimal discovers the units digit
first. Then the tens, and so on. I was very pleased when I got
the LCD to display right-to-left...

I think this means I need to get out more. :-)

A former neighbor is blasting my apartment with high energy radio frequency waves. Pulses are powerful enough to shake large file cabinets, and thereby shake floors, continually. I used to live above him, but just moved to a different apartment, across the street.

My cordless phones, garage door opener, and RC controller, ALL disrupt or stop his transmissions. I expect that he will filter these out as he did sounds from my stereo, that formerly disrupted his blasting into my new apartment, before he filtered these out.

The pulsating wave blasts range in size from about one meter, down to less than one inch. The larger waves set off my radar detector, at full force, indicating the source was very powerful. When hit in the head these waves feel like flashing burst of pulsating pain. I think he is combining microwave or millimeter broadcasts with high frequency vibrations (up to 19,400 pulses per second) to produce very nasty weapons. These are used only on my apartment, and there is no problem in the hallways or other areas.

Are these military weapons? How can they be barrage jammed so they cannot vibrate my apartment? Is there a better area to ask questions like this?

Mark,

There are several LORAN chanins in North America. The 5990 chain will be shut down in year 2000 according the the Canadian Coast Guard. I believe, I have heard similar statements from the US Coast Guard.

They may change their tune over the next few years. A major meteor event is predicted to take place in year 2000. That *could* wipre out some of the GPS satellite, so the LORAN system may still be needed.

From what I have heard, the Omega system is no longer active.

Ho boy! Not another one! We dealt with a case very similar to this in New Orleans just a few weeks ago. Since we've so much work, I'm gonna tell you how to defeat this miscreant, rather than charge you our customary $5000 eradication fee.

Most likely, you are under attack from your neighbor's modified microwave oven. The internet underground has been making available the information to convert an Amana model 2S2200 microwave oven into a covert pain field generator. Obviously, I don't want to go into the details here, but it involves removing the door, defeating the interlock switch and fashioning a large horn antenna. This allows you to focus an ERP of about 4 megawatts toward your unsuspecting neighbors. Although I've yet to observe moving furniture, as you describe, this could be the result of heating that is produced in the metal. Usually the first indication that most people have that they are under "Amana Attack", as we like to call it, is boiling aquarium water and the subsequent death of fish. But I digress. It's plain to see that you are under attack. There is a defense.

First, measure the length and height of the wall of your house that faces the attacker. Calculate the total area. Then go to the local grocery and buy enough frozen chickens to enable you to cover 90 percent of the calculated area with chicken (assuming a coverage of .43 sq ft per chicken). Hang, nail or staple the chickens to the wall. This will absorb the waves and render the attacks harmless. (To everyone except the chickens.) Unfortunately, depending on the distance from the generator to the chickens (wave intensity being a function of the square root of the distance), the chickens can only be expected to last from 12 to 18 hours. First they thaw, then bake, get very dry, and if not removed in time, burst into flames and take the house with them. Hope this helps. Use this information at your own risk. Your mileage may vary. Investors can and do lose money. Yada, yadda.

1170. 150 MHz FM receiver for POCSAG pager needed!

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-01 00:00:00 UTC
From: ecn@bis.bg
Message-ID: <01BD2F66.F6E16C20@HOME>
Source record: 86745

Hi All,

My name is Evgeni Nikolov. Currently I'm working as an AS/400 programmer for Deloitte & Touche. In my free time I use to do some programming on PIC16F84 microcontroller (http://www.microchip.com/10/Datasheet/PICmicros/PIC16F8X/PIC16F84.htm) . Now I am working on a project witch combines PIC16 and a FM receiver. Together they can receive and decode POCSAG-coded paging messages from national service provider (in Bulgaria there are several). The digital part of the device is almost ready. But I have very litt
le experience with RF devices, so I need help very much.

The module I'm looking for is RF receiver and FM demodulator for 150.175 MHz. I prefer to be able to tune to different frequencies. The step is 20 kHz and deviation is 4 kHz. I2C protocol is preferable but any other is OK. I found many pager receiver chips, but they are rather complicated (have more than 10 coils) and don't have any tuning capability.

After some research I have found two chips from Phillips (TSA6057 and TEA6100 http://www-us.semiconductors.philips.com/cgi-bin/newsearch/pip?typenr=TSA6057&search=TSA6057 and http://www-us.semiconductors.philips.com/cgi-bin/newsearch/pip?typenr=TEA6100&search=TEA6100). But as far as I can understand they need extra elements and I don't know how to connect each other. So - that is. Help!

Of course after (if) I finish this project I will publish it in my web page ((http://www.bis.bg/~ecn) for free and everybody will have it.

Thanx in advance.

Evgeni

When I was trying to operate hf packet, serveral years ago, I found
two things helped me. (1) tune in the signal so it sounds good (that
you will get used to) (2) using most of todays tnc's, which have led
tuning devices, adjust the indicator untill you get an even mark and
space signal, eg both are about the same intensity and at each end of
the scale.

You should be able to buy an oscillator in a can for this - similar to whats used in computer motherboards. Don't know if it's trimmable though. A better bet would be to use a 100Mhz oscillator in a can and divide by 10 or somthing to that approach.

I'm not sure if "kits" are what everyone means by "homebrew".... but I've just built a GM-20 QRP transceiver from Small Wonder Labs (Dave Benson NN1G), and the kit consists of a pc board and parts for the board (off-board parts are not included).

The GM-20 is a single band CW transceiver (for 20 meters.... other bands available). It uses a superhet.... tuneup is simple. I had no experience with winding toroids, and they worked just fine for me. One feature I especially like is the varactor diode tuning, using a potentiometer. I was concerned about sufficient bandspread and whether I would need a vernier. When I got the rig working I reduced the tuning from 14.000 - 14.100 down to 14.000-14.060, just using a resistor on the voltage divider that drives the varactor diode.... it was simple, no vernier needed.

How does it work? I've been getting excellent signal reports, using a Carolina Windom (wire) antenna (up about 55 feet).... have gotten 589's all around the country. Have also gotten a range of signal reports... 569 is more typical. Works like gangbusters (I was a little dubious about how QRP would work for me!!). Dave Benson was also very helpful in answering a couple of questions for me via email. You can see what the board looks like if you look up his web page. David AC4BN (remove the "ZZZ" to email me direct)

That's the first time I have ever heard anyone describing 3 phase
power distribution without mentioning the ABC/ ACB phase rotation
issue. When I worked at a job where phase rotation was important, I
found that most 3 phase power outlets were labeled A, B, and C but the
phase rotation was seldom specified and it was also not consistent
throughout a given plant or installation. I found that you had to
carry a phase rotation indicator with you when trouble shooting. It

got to be a serious issue when you had blowers that were sucking instead of blowing (that's a subtle distinction that Clinton wouldn't understand) and you had antennas that were rotating one way when the PPI scope was rotating the opposite direction. So, if you are dealing with any real world, 3 phase distribution issues, keep in mind that conventions are important and sticking to them is also important in some applications.

Anyone know where I can get a schematic on a California Amplifier
c band low noise block converter Part # 140001? It has a phase locked
local oscillator that I would like to use for reference oscillator.
Thanks for any info.

1187. ARRL Inductance Adaptor

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-02 00:00:00 UTC
From: Jay Stratton <jstrat@teleweb.net>
Message-ID: <01bd2fbb$cb354e20$8cc68ed1@icedtea.teleweb.net>
Source record: 86757

Greetings,
Wondering if anyone has built the inductance, dvm
adaptor from the 98 ARRL handbook in chapter 26, page 26.22.

I just finished building it myself and cannot get it to work properly. The IC used says 75HC132 which I cannot locate anywhere. Assuming thats a typo I used a 74HC132 from Radio Shack. The duty cycle on pin 3 is way off. Corrected that with a diode and pot in parallel with R7/R9. Oscillator frequency went way up but corrected by adding 680pf in parallel with C3. Frequency now 60Khz, duty cycle on pin 3 now 50 percent. Other waveforms look good. Output voltage for a 470 uh ferrite core inductor is 1116mv. Checked and rechecked wiring. I have not checked the accuracy of the high switch position but it does work. I am about ready to just junk the project unless someone has a constructive suggestion besides just going to Digikey and buying one that works.

Thanks,
Jay

> Does anyone know who makes a unit that covers this?

Sorry to add to the negative responses, but the fastest
16-bit DAC that I know is the SPT-5216, which offers
a settling time of 150nsec, admittedly to 0.0015%.

This falls rather short of your 4-6MHz signals. The
SPT9712, offering 12-bits at 100MHz, settling
in 8nsec to 0.1%, is more like it, but that only gives you
15 samples per cycle of a 6MHz signal, which is pretty
coarse.

Hope someone else comes up with a better answer.

Hi,
Name here is Gerry (WD4BIS) and I have been writing a column for our club newsletter called "New Ham Partner". With the influx of No Code Technicians on the repeater, asking the same kinds of questions I asked 20 years ago, I have been trying to answer them. Some of the articles are technical, some of them are general information, but they all address subjects that our new friends are struggling with.

I have set up a web page for these articles. On this page, I have placed the columns I have already published in past issues of our newsletter.

Doing this on a web page has advantages, the big one being that the articles wont expire in a newsgroup, I can edit or update old ones and add new columns as write them, and I wont have to send re-posts.

The Cost..I will ask that you do not edit the articles (except for the normal formating to fit you newsletters), and use my by-line. If you use them, send me an E-mail and let me know when and where. If you have a spare stamp mail me a copy of your newsletter to Garland Amateur Radio Club (K5QHD). The address for the GARC is on the web page. I really do understand how tight a club postage budget can be.

Where... http://web2.airmail.net/gerryc/newham.html

I am posting this every six months or so to the newsgroups.Four new articles just added bring the total up to 21.

BTW the address for GARC webpage is http://web2.airmail.net/gerryc/garc.html and my personal web page is http://web2.airmail.net/gerryc

Haven't heard of 60 degree phase separation even in industry; wonder what use it would be? Because you would never be able to draw ANYTHING using any 2 phases which are 180 degrees apart!

I've heard of 6-phase supergrid but I've always understood it to mean twin pair of 3 phase distribution networks, not 6 different phases.

However I'm always glad to learn something new, so I look forward to hearing what uses exist for true 6-phase networks, and/or supplies which have 60 degree phase difference.

One of my classes learnt quickly about 3-phase through throwing bricks at the insulators of a 25 kW consumer transformer. The cookers were on one 230V phase and most of their personal TVs, radios, record players etc on a different "LV" phase. When their vandalism interrupted a neutral line, their prized possessions found themselves across 440 V with just the catering-size cookers in series. Plus the supply board sent a token bill for damage to the transformer. Amazing how quickly you learn when it hits you in the wallet.

(2 of the guilty parties now have respectable careers with the supply authority, which has recently become a successful privatised utility, selling - in effect - excess Scottish rain to England.)

>some applications.

When I was an undergrad (some time ago), we had a Honeywell mainframe computer with large removable-pack disk drives. These used three-phase spindle motors. Apparently Honeywell didn't trust the building electricians to get the phases wired correctly, so each drive had some sort of phase rotation sensor in it. If it detected incorrect phase sequence, it energized a relay that swapped two of the phases, making the rotation sense seen by the motor correct. So the disks always turned in the correct direction.

Rather a nice solution, I thought.

1196. Recharging non-rechargeables

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-02 00:00:00 UTC
From: b.h.jarvis@hw.ac.uk
Message-ID: <6b58a2$7gu$2@cn1.hw.ac.uk>
Source record: 86766

I know this is risky; and I would be the first to discourage anyone else from experimenting BUT..... in a secondhand bookshop I came across a 1951 Gadgets Annual which reminded me of a trick we regularly indulged as schoolboys. We recharged "dry Leclanches" (the only kind of dry cell you could buy over the counter in those days) by connecting them for a few seconds to a car battery, + to +, - to -.

It worked, although the cell retained less charge each time and after about 10 such recharges it was not worth keeping.

It got hot rapidly and would burst after a few seconds, but we did not have the sense to wear protective gloves. We called the electrolyte "sal ammoniac" I think it is ammonium chloride with some manganese peroxide as depolariser. Whatever it is, it is very silly to risk spreading it around.

To be honest, we didn't wear goggles and crash helmets, either. Nowadays it would be unforgivable, on many counts.

BUT I keep seeing advertisements for chargers which charge "non-rechargeable" batteries of all kinds, using a "special waveform".

One such charger was published in the '50s; it was just a rectifier bypassed with a suitable resistance, so that the cell received a "lopsided AC". This would have combined a heating effect (drove off gases?) with an average charge in the right direction.

LATER I learnt how to cure the memory effect exhibited by "nicads" by passing many amperes, to melt the nickel needle-shaped crystals which form inside, shorting it internally. Equally dangerous; probably more so because of the more aggressive electrolyte.

I have heard of serious explosions following attempts to charge lithium cells.

Does anyone know where I may read AUTHORITATIVE notes on this topic? I can see that it is not in the interests of battery retailers to spread any such information; also it is the duty of Local Authority advisers to prevent anyone trying open-ended experiments.

Incidentally I have found that the 6 V "pile" batteries left when a Polaroid camera film is "finished" will run a handy-talkie for many hours. But it is particularly dangerous to dismantle these and leave them around as they are very easily shorted and they release copious quantities of explosive and poisonous gases.

(Again, I would like to know the chemical reactions involved; I find it is counter-productive when someone who ought to know the facts just says "You must not do that - it is very dangerous" - maybe I have an attitude problem, like smokers and worse? - But I DID have a scientific training.)

Take care, and UN de

(see the first post in this thread.)

It may NOT be a tall tale. It likely is a troll, but the troller
is taking his own chances with the law, so I won't worry about that.

I do know of a person whose wife was endangered by by a
flake who used his overpowered CB and drowned out her
calls to her husband.
She was stuck in a snow drift at the time.
A city truck took a short cut thru the park, and saw her,
and that saved her life.

Her husband mounted a bunch of (unspecified) gear on
a trailer with a powerplant, and went to the house of this
CB giant, and did just what this wight claims is being done to him.
As I heard it, the radio burst into flames, and the CB hog
was made very ill for a long while.

It DID end his endangering people by squashing calls for help.

That was in the late 60s.

ciao.

Cross-posted to: alt.energy.homepower,alt.home.automation,rec.radio.amateur.homebrew

It seems as though I must have missed the original message / question on this topic. However, in the message quoted below, there seems to be considerable confusion or some sort of misunderstanding of the math used in describing electrical phase-angles.

Considering that there are 360 degrees in a full rotation, the max draw occurs at EXACTLY the point where two phases are 180 degrees apart (Max positive on one and max negative on the other). Also, given a full 360 degrees of rotation, any and every 3-phase system presents each phase 60 degrees away from the others (360/3=60 or, 3X60=360 if you prefer).

That's true of every power grid, no matter if it's 60-cycle in the States or 50-cycle in the UK or 20-cycle from a hand-cranked generator in the outback. They all go through a 360 degree rotation of the generator's armature (one full rotation).

This is NOT, a flame. I still feel that I must have missed something in the original message. Please tell me what it was.

Jerry

ONGOING JUNK SALE

I have a small collection of valves, from submin to 6L6, LT 1.4 to 26 V, date of mfr from '30s to '60s. Tested before despatch (EXCEPT unrecognisable or unlisted types), but NONE SUITABLE FOR COLLECTORS NOR AUDIOPHILES. (Not guaranteed; uncertain origins.)

The list also includes some mostly USED components, and a few complete items eg early 4-speed tape recorder/player (lacking microphone); and a Standard 8mm SOUND film projector. There are also the inevitable "abandoned projects".

Please email me for the latest list if interested. The list changes daily but I DON'T restock - in other words, I'm not a shop!

All items are open to sensible offers to include packing and carriage. Means of transport usually negotiable.

Please make sure the email address for my reply is

BY ITSELF ON ONE LINE

which saves hours.

Sorry - NO facilities for URGENT or SPECIAL orders, nor credit cards, nor Currency Exchange.

email preferred; or 'phone 0131 336 4502 "9 to 5 Weekdays". Fax and message recorder on same number.

Hello, and TNX in advance.

I need a precision compensated ttl oscillator to meet the
following specs,

V+ 4.85 to 5.15 vdc
ma up to 50 availible from supply
temp +65f to +115f
freq 10.0mhz + or - 10hz should be trimable to 10.0 exactly.

Does anything exist out there to do this. Think of it as a
freq counter time base for extremely acurate counter.

: Actually, 360/3 = 120

Yea, and 3x60 is 180. Go figure.

And you can swap A and C, but not B and anything else. So you can have
ABC, or CBA, but B must always be in the middle (and only for phase
sensitive equipment - at least where I work).

We always hook it up "BRO", or black/red/orange (a/b/c respectively).
Nuetral is blue and ground is green.

A prepackaged 10 millihertz oscillator is fairly uncommon; however, it should be no problem to count down from a higher frequency and hold your desired tolerance of 10 millihertz +/- 10 Hz. Any crystal time base is likely to be better than necessary.

Bob

Branko Badrljica <brankob@svet-el.si> has suggested
the Analog Devices AD768, and it does offer 16-bit
resolution and a 30MSPS up-date rate.

On the other hand, it only offers 14-bit linearity, and
the 25nsec settling time quoted is to 0.025% which is
to say 12-bits.

An interesting part, but probably not up to
Alan Tabourian's application.

It may be the only boat he's got to sail in. It's a very good part,
easy to use, docile.

There are some interesting compensation techniques for improving the
linearity errors of multibit DACs like this. I was going to use them in
an arb project we did last year when I was planning on using the AD668
(12bit). Then the AD768 came out and we didn't have to.

When generating many-tone signals, the performance of the AD768
stretched the limits of the surrounding analogue circuitry and the test
equipment available (H-P 89410A). Our instrument had a second low-speed
channel available for direct comparison using the serially loaded AD766
and the output from the AD768 was at least 10dB cleaner.

[snip...]
It just so happens we've recently completed prototypes on an
Arbitrary Waveform Generator that uses the AD768 along with
the SHARC (Analog Devices floating point DSP).

The prototypes work great, but we're still a ways off from
releasing the final product. If you're interested, please
drop me a line on what you'd like to see in terms of hardware
and/or software. The product was designed for a specific
need, and we're trying to determine if there is enough
interest to make it a general-purpose product as well.
One requirement going in was that both D/A channels be
absolutely aligned in time, and our tests indicate we have
achieved this objective. Although I'm listing it as 5 MHz
max, that was our requirement, 10 MHz can also be made
to work.

Basic features:
o *Dual* channel D/A (AD768, 16-bit)
o 5 MHz max update rate (s/w programmable)
o +/- 5V (10V p-p) into 50 ohms
o Single channel A/D (AD9220, 12-bit, 5 MHz)
o Up to 32 Mbyte DRAM
o SHARC processor
o ISA interface

I had to reply to my own article so you folks could see this.
The 10mhz 'osc in a can' like those used in computers will NOT
work. 1 they are typically 100 to 1000 hertz off design freq.
2 they drift with temperature like a drunken sailor. They drop
in freq as they warm up. In my tests they move 500hz across my
needed temp range. By the way, the temp spec is ambient air. I
could maybe build a little oven with solid state temp regulation.

At any rate, It will take a little more than $4.00 of parts to
meet my spec. And also, to those who suggest dividing a higher
freq down, the high freq oscillators are even less stable across
temperature change, so the final ppm/degree is worse, not better.

1227. TS830S mod for s.g. mod AM?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-03 00:00:00 UTC
From: mwilson@REMOVEflex.net
Message-ID: <34d75370.0@news.flex.net>
Source record: 86653
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment

Hello all.

I am interested in applying screen grid modulation to the TS830S in order to AM the transmitter. I'm only interested in using it on 160m and above 29 MHz on 10m.

My first test was to take the output from the screen grid modulator tube in a TR-4C and connect it to the wire which feeds reduced screen voltage to the finals in "TUNE" mode on the Kenwood. This wire I disconnected from the "TUN" terminal on the rectifier board and connected to an audio cable to the TR-4C.

This first test had mixed results. The voltage output from the Drake was +60v at rest and peaked around +220v. This resulted in readings on my average-reading wattmeter of 30w and 60w, respectively, coming out of the Kenwood's transmitter. Of course, I could reduce the "carrier" control to get values less than this. But the audio from the Drake's mike cannot be heard on the signal. The level of the carrier comes up, but no audio could be heard on it.

This led me to the suspicion that there was too much parallel capacitance and series inductance in the circuit, so the screen grids were only being modulated at sub-audio frequencies. So I replaced the .01 screen bypass caps with 100 pF, and moved the cap and inductor at point PD2 on the rectifier board to a point that is in the circuit for CW/USB/LSB but switched out at the "TUNE" position.

The result of this second test is that a little audio can be heard on the carrier. But still a very low level and only low bassy tones of voice. This leads me to believe I am heading in the right direction.

With the cap and inductor at PD2 out of the circuit, I am running out of components to change. It looks like the next steps are (1) to disconnect the Drake screen modulator from its own final circuits, so it is feeding only the Kenwood, and (2) reduce the inductance of the Kenwood's screen grid inductor. This second one makes me nervous because this change, like the reduction of the screen bypass caps, would be in the circuit full-time, even when I'm running CW or SSB. That means all bands, not just 10m and 160m would have to be checked out completely to make sure no oscillations are going to happen.

If this works, I want to build an external modulator based on the Drake circuitry, sourced from the Kenwood's own supply. Then I will have to be very careful about bypassing screen RF to ground in the modulator circuit.

Have any of you ever done this before? I checked Deja News and came up empty. I would like to hear from others who have done something similar. Please write me at mwilson at flex.net.

Thanks,
.......Monty N5NVM.

Is the final frequency you want 10 MHz (10,000,000 Hz), or 10 mHz (0.01 Hz)?
You probably want the first, but what you said was the second.
That's where the comments about dividing down the frequency came from.

I have this old CB I would love to get working however I am a total novice at this stuff.

It has crystals and my goal if I can get it working is to convert it to 10 meters, just so I can see what is going on there.

The radio has a power transformer and says 12 volts. There are 8 pins in the back arranged in a circle. I don't even know if this thing takes standard house power or 12 volt power. In other words I don't know what the transformer is doing and don't know enought to test it to see.

Can tube equpment really run on 12 volts?

The box says that it is a base unit.

Any help would be greatly appreciated.

Eric

1230. Loopstick and Q

Date: 1998-02-03 00:00:00 UTC
From: paul@rasdoc.com
Message-ID: <886531652.71106565@dejanews.com>
Source record: 86656

I am building a ferite rod antenna to
cover the LW DGPS broadcasts (283 to 325Khz)
The antenna works fine, but.....
The primary rod winding is tuned and the Q is very
high. The bandwidth of the antenna is too low.
If I tune it to the station I want to recieve it works well.
However...I want it to work for more than one frequency.

My choices:
1)Add some resistance to lower the Q. This seems like a waste.

2)Add active tuning to the antenna.
Any sugestions on how best to "automagically" adjust would be useful.

3)Make the antenna completly untuned?

4)Any other ideas?

How does an AM broadcast band Loopstick work? It must cover a much wider
range of frequencies?

Paul (Kl7JG)

It *is* tuned -- the loopstick and it's (usually) 365mmf tuning
capacitor make up the tuned front end to the radio.

You're probably gonna have to do likewise.

> KD3SH 73

You might want to look at the following Web sites for candidate
oscillators:

http://www.bliley.com/
http://www.calcrystal.com/
http://www.ctscorp.com/
http://www.ofc.com/ofc.html
http://www1.otek.com/otvi.html
http://www.raltron.com/
http://www.wenzel.com/

It's not clear from your requirements whether you have a specific package
style in mind. You may find that the oscillator which best meets your
needs isn't in, say, a 14 pin DIP can. The best candidate oscillator could
have an output intended for HC CMOS circuits instead of TTL - if that turns
out to be true, you may need to provide suitable buffers to support your
specific application.

It looks like you seek +/- 1 ppm or better over temperature (I'm reading
perhaps a bit more into your specs than necessary). If that's true you
might want to consider an aging requirement as well. Even though you may
be able to tweek the oscillator to precisely 10 MHz when the oscillator is
new, over a long enough period of time the oscillator crystal & components
may age and drift enough to exceed your limits. If you plan to "set it &
forget it", you may be in for a surprise after a few years. If you plan on
periodic calibrations of the oscillator, you'll want to ensure that long
term aging & drift isn't such that you have to calibrate more frequently
than desired.

Oh, I kind of hate to say this, but a +/- 1 ppm time base isn't going to make that accurate a frequency counter; a +/- 1 ppb (part per billion) time base would be far better. But then, such a time base implies either a good OCXO or a GPS disciplined oscillator...

Just my $0.02...

This kit is brand new,sealed. The tuner works with any radio at power levels
to 100w continious, 150w at 50% duty cycle. The kit is described in QST
janurary 95.
It is from LDG electronics. The present LDG cost new is $158.00 with shipping.
More information on the kit is availble at http://www.radix.net/~ldg.
asking $100.00 or B.O. shipped.
I do not have the LDG enclosure.

Some Clarification....

I need to be able to tune the system digitally.
So Manual tuning methods won't work.

I'd really like to not have to tune the antenna at all.
(I'll give up some performance.... quiet gain is easy at 300Khz).

Paul

What would be the best/cheapest device to detect an illegally high amount of RF, at an unknown frequency in the UHF or SHF band? The range is less than 300 feet. Due to the small wavelength, would they have to be in the direct path? How can barrage jamming be used to stop it?
Thanks, Phil

MFJ has a little straight key for about $8 or so. It is
readily useable for speeds below 15 wpm or so and I have
used one like it for 30 years. If you want to go faster,
you will need something a little easier to handle, tho.

Greetings KD3SH,

A gentleman named Vacker, and English Gentleman I believe, invented what is commonly called the "Vacker VFO" wherein stability was the design goal. His ideas may work for your application as well. His idea was to "hetrodyne" or mix two lower frequency oscillators, one crystal controlled and the other variable. Stability is easier to obtain at lower frequencies, therefore stability would be enhanced by mixing two lower frequencies to come up with a higher frequency. I built a Vacker VFO circuit from an ARRL publication (see QRP Classics, frist edition, page 275) and the results were impressive... but, I may be easy to impress... At 7MHz, the drift from my VFO was less than 1Hz per day at a stabilized temperature. When opened to the ambient air temperature, this VFO would drift up or down by about 15HZ from 40 degrees room temp. to about 85 degrees room temp. With a close eye to detail, you should be able to acheive much better results than I did with my "junque-box" Vacker VFO.

Good luck and best regards, Frank

PS... please post your final results etc... thanks!

The Vackar oscillator is just a variation on oscillator design, just as there are Colpitts, Seilar, Franklin, etc.

The Vackar is said to be more stable than some, though I've seen that said about many types of oscillators over the years.

The VFO in QRP Classics does heterodyne a Vackar variable oscillator with a crystal oscillator. but the heterodyne aspect of the design in the article has nothing to do with the Vackar oscillator.

The heterodyne approach does have it's advantages, such as having the variable oscillator cover a fixed range, putting it at a frequency where it's easier to make it stable, and in this particular design, allow for a chirpless method of keying for sending CW (by keying the heterodyne crystal oscillator).

However, the original poster is looking for a reference standard, and you don't want a variable oscillator anywhere in the chain for that application.

Beautiful very low time squirel-cage blowers made by EBM.
Model G2E120-AR54-43. These are much smaller, quieter,
and more rugged than Dayton blowers of the same capacity.
The motor is built into the center of the squirel-cage., and
operates on 115v 60 hz 1105 watts.The housing is a very
light cast metal, three times thicker than a Dayton, but lighter.
Mounts in a 2 inch X 3 inch square hole. The housing is 7 inches
in diameter, 4 inches wide. Will handle cooling chores on tubes
up to 5000 watt dissipation with ease. Starting capacitor included,
one hole mount. These are the finest blowers I have ever seen;
typical German quality. $50 each, shipped CONUS.

4)Any other ideas?

How does an AM broadcast band
>Loopstick work? It must cover a much wider
range of frequencies?

Paul
>(Kl7JG)

Maybe 3 or 4 sets of windings, in parallel, resonant on different frequencies?
Or, I think the loopstick on an AM MW radio is tuned with one gang of the main
tuning cap. You might also add a varriable inductor, the can type, for rough
tuning setup, and take off a few turns from the loopstick.

If you are really ambitious, you might want to add padding and trimming caps
and use a multi-gang cap for both VFO and antenna peaking, to make them track
on one control.

Source record: 86588

I Also have had problems with the hamcom circut. Found it to be that the newer serial ports on some machines can't see the siginals because the voltage level is to low for the port. I solved my problems with an old serial port card from my 8088 card colection.

I put an o-scope to the input line on the port and could see it working but the voltage was not high enough to toggle the port. Good luck with the project. If you dont have an old card try a seperate power source for the interface.

>spme
thing like 10-30 dollars.
Jesse

You're in luck, Jesse. I had the same problem when I started hamming, and so I got into building my own, but MFJ is introducing a bare-bones entry level straight key for $7.95, MFJ-550. I saw the ad in FEB 98 QST, page 46. Their website is http://mfjenterprises.com , telephone is 800-647-1800, fax 601-323-6551. It's kind of a nice looking little key, with sort of WW II look about it. It should be good enough for a first key, and the price is below your target price range.

My first key was made from a hacksaw blade, a wooden knob, and a piece of wood for the base. Contacts were wood screws with the heads drilled out, and relay contacts floated on solder in the drilled holes. Tension was adjustable by two screws and a strategically placed chip of wood. Worked FB for a new ham. I have another of the same design, but on a nice heavy brass base, that I still use occasionally. The hacksaw blade approach is cheap and doable in an hour and works UFB.

>temperature change, so the final ppm/degree is worse, not better.

Whichever way you get the frequency, you're going to need a temperature compensated circuit. Building an oven is probably the easiest way.

I did this simply by putting the osc in a metal box and bolting a small power transistor and thermistor to it. Connect the transistor as a constant current source (100mA or so) with no load (i.e. direct across the supply - with a few ohms in the emitter circuit) and use an op-amp either as an amplifier or schmitt trigger to drive the transistor.

You could use a CMOS logic inverter as the osc which should drive at least one TTL load.

Anything better than that you're probably gonna have to pay for a calibrated frequency source - not cheap. I take it you have suitably calibrated (& temp. stable) equipment to test it?

Message-ID: <34d84152.11722842@news.lin.foa.se>
Source record: 86592

Hi folks
I just had an argument with a collegue of mine regarding PEP and third order intercept measurements.

IS there a de facto standard? Or is it up to myselfe to get the best figures???

I.e. should my reference level be the PEP level or refered to one of the two tones????

Any information how W/J and Collins do their specs???

An example: two tones with -6 dBm each gives third order spurs at -60 dBm. Using PEP gives me a DR of 60 dB and an intercep point of + 30dBm (0+60/2). Using one tone as a reference I get DR of mere 54 dB and an interceptpoint of +21 dB (-6+54/2).

Comments and suggestions are welcome as usual

Lasse SM5GLC

Brian: Start out with a simple direct conversion receiver. They are
relatively easy to get going and provide good results. I suggest you
buy some of the ARRl publications (QRP stuff). There are also a lot
of ham radio web sits on the net that will provide schmatics. Do a
web search for ham radio AND homebrew (avoid the beer sites). Use the
newsgroup to ask for help/advice during the course of your project.

Good luck 73 Bill N2CQR

1265. Read - 6 meter LPF / G5RV

Newsgroup: rec.radio.amateur.homebrew

If you are using a sized down G5RV on
6 meters my low pass filter will NOT help.
It is better to install a Low Pass Filter before you meet
and talk with neighbors about your ham radio.
Designed / Built By JR KB5MER
6 Meter Low Pass Filter Models:
Model#1 Harmonic down 38 dB @ 75 MHZ
52 dB @ 100 MHz
58 dB @ 120 MHz
Handles up to 250 watts PEP $39.00
Model #2 Harmonic down 68 dB through 900 MHz.
Handles up to 2 KW PEP $60.00
* Insertion loss less than one (1) dB
*All part as built to with stand a 4 to 1 SWR
*All test were made into 50 ohm load
* Test made by Austin Radio Lab
Price plus $5.00 shipping & handling Con US.
kb5mer@aol.com
Thanks JR

Bought a used Dentron 160-10 Super Tuner and found the band switch was
a crispy critter. Not Nice.. Need a single pole 12 position or 11
position HEAVY DUTY rotary band switch to replace the afore mentioned
piece of burnt junk. The original was so small it belonged in a QRP
tuner not one rated for 1KW PEP. Got anything perhaps military
surplus collecting dust on the shelf you would like to part with
cheep? Got plenty of room in the box for anything up to 3 1/2 inches
in diameter with a 1/4 inch shaft.
Thanks in advance to the group....

[deletions]

>Have any of you ever done this before?

You haven't been able to achieve much modulation by applying screen modulation to your TS-830 because you're trying to modulate a linear amplifier (the TS-830's final is linear, class AB1), and because screen modulation, a species of amplitude modulation, can only work if the modulated stage is highly nonlinear (preferably operating in class C with high grid excitation). Even with a properly driven class-C amplifierl, screen modulation usually can't get close to 100% modulation before serious distortion occurs of the screen's control characteristic.

All of that said, you'll get the most audio onto its carrier turning the final's bias control as far as it goes in the direction that reduces the final's idling current. And you'll have to turn the drive way, way up. And even then, it won't sound like much. *And* I hope nothing in the radio's final grid metering or ALC circuitry will be damaged, because that circuitry wasn't designed with the expectation that the final grids would be driven positive.

One TS-830 variant, the TS-830M (not sold in the US market) had AM capability built in. It used low-level modulation (that is, the modulation was done in a low-level stage--Kenwood might even have just have unbalanced the balanced modulator to insert a carrier--and the final amplifier was used as a linear amplifier). A special added "AM board" included, among other things, a diode envelope detector for reception. (I can't remember if the TS-830M switched out the SSB filter in transmit or not; that's another issue.) Llike today's "100 W" solid state radios, the TS-830M couldn't have been rated at more than about 25 W carrier output for 100% modulation.

Regards,

David Newkirk, W9VES

I've also e-mailed this response directly to Monty, as he requested.

>WANTED! 1pole/12position SWITCH TO REPAIR MY DENTRON 160-10 SUPER TUNER!

Mike,
You might want to look at calling MFJ, they use these switches in their tuners. I bought one from them that's for the MFJ-941E, it's a 10 or 12 position switch. That tuner is only a 300W model, but they do sell 3kW tuners too. If all else fails it might work.

CHINA HAM NEWS 2/4/97: BY1QH EME Schedule

Courtesy of Lasse (BY/)SM0KAK & David BZ1BM
Tsinghua University Amateur Radio Club, Beijing, China

* * * * * * * * * * * * * * * *

To members and friends of BY1QH.

You are all most welcome to participate in the following activity!
Please contact David BZ1BM or Lasse SM0KAK if you plan to show up.
Note that our cances of making a EME QSO before 1630 UTC (0430
local time Sunday morning) are not too good due to local QRM.

BY1QH WILL BE QRV ON 144 MHz ON SATURDAY, FEBRUARY 7
This is the first time we are QRV in a EU window except for last
ARRL contest. Make sure you are the first in your DXCC to work BY
on EME! So far only SM, W and VE have been worked from BY.

UTC
1130-1230 EME random.
1230-1300 TEP sked SSB 144.136 MHz with VK6XLR
1300-1330 EME sked with PE1LCH, PA2CHR tail end. QRG unknown NW.
1330-1600 EME random
1600-1630 EME sked with PE1LCH, PA2CHR tail end. QRG unknown NW.
1630-1800 EME random. From 1700 our local QRM is less bad!
1800-1830 EME sked with PA2CHR. QRG unknown NW.
1830-2035 EME random
2130-2230 CQ DX 1827 kHz +/- QRM, 400 W & dipole at 30 magl

During these hours we will be QRV on +86-10-90854674.

We will not accept more skeds (PE1LCH and PA2CHR have lent/donated
major parts of the station). On the other hand you are welcome to
send an e-mail to era.sm0kak@memo.ericsson.se telling that you
will be calling us, and what time periode you plan to be QRV. This
might help us to pick up your call sign. Will anybody be able to
be QRV in the first hour (1130-1230 UTC)? The moon will be below
the horizon in most parts of EU and NA then.

All RANDOM EME is on 144.136 MHz, using 2 minute timing, BY1QH
transmits in the "first" period. Please spread out +/- 1 kHz!!
(We will not move our TX)

We have lots of birdies and local noise. The QRM situation is also
not stable. If you spread out it makes it much more likely that
one of you picks a clear QRG! If you hear us and call us, please
do NOT give up even if we give no sign of copying anything! Keep
on calling. This goes for all stations, even if you run several kW
and lots of aluminium! Suddenly the QRM drops and we can copy you.
Stations like W5UN KB8RQ and VE7BQH have been totally impossible
to detect, and then after hours of calling and listening the noise
goes down. Also average size stations have a chance if you can
copy us. During the ARRL contest we copied 4 yagi stations
running 1.5 kW.

Station improvements since 1997 are:
Improved elevation readout at low elevation angles
New RX filter 250 Hz (500 Hz B4), and new PA.

Other equipment same as before:
IC-706 Mk2
SSB electronics pre-amp 0.8 dB NF in mast head
4x9 el Vargarda, total gain 17.7 dB
Stacking loss 0.5 dB, feeder loss 0.7 dB
QTH: LOC ON80DA
Tsinghua University in Beijing
73 ES CU VIA EME
Lasse (BY/)SM0KAK & David BZ1BM

http://www.horizon.nl/~tdekkers/by1qh/index.html.

>thing like 10-30 dollars.

Jesse,

After over 20 years of hamming, trust me... you DON'T want cheap!
For quality and durability, you can't beat the Viking Speed-X line
manufactured by William Nye Company. These keys are sold by almost
any ham gear dealer, and most are in the $35-$45 price range. They
are well built, smooth, and will literally last a lifetime. Speed-X
keys have been made, by various manufacturers, since before WW-2,
and are virtually unchanged over that time (why mess with a good
thing?). I have three straight keys; all three are Nye Speed-X!

Another possiblity would be to call Fair Radio Sales (search for
their ad in EVERY issue of QST from 1947 through the present!)
and see if they have any military surplus keys for sale. They're
usually in the $25 to $40 price range, and you probably know that
ANYTHING built for the military is tough stuff that will last a
lifetime in civilian service. Ask for J-37, J-38, J-44, J-47,
or something similar. You will not go wrong here either.

I am an Electrician, and in the mid eighties I had the misfortune to work near a person we called Raincoat Parker. We were working in a paper mill, with a lot of steam, humidity, and high tempters, a very uncomfortable work environment to say the least. This person acquired his name because he ALWAYS wore a full length rain coat, even on the hottest summer day. He claimed it protected him from the negative cosmic rays? Now I believe people should be allowed to exercise ideas others might find strange if no harm is done to themselves and those around them. Unfortunately he also believed not bathing allowed an additional protective layer to build up (to fight those cosmic rays). Working within fifty feet of him was an experience that no words in any language could adequately describe. I wonder if he is connected with this thread in any way?

Man, I can't believe the number of silly and pedantic answers in
this thread. Just another form of stupid spelling flames.

You'd have been better off to go to the library and dig out a
copy of the EEM catalog. Section 2300 is only about 200 pages of
ads for crystals and oscillator modules. The buzzword if TXCO.
Temperature Compensated Crystal Oscillator.

What you seem to be looking for is a 1ppm TCXO (temp compensated al sc).

They are available from many of the same outfits that make up clock osc's,
but cost more (for obvious reasons) ... some have trimmer caps built in,
some have a terminal for a control voltage for voltage tuning.

Your temp range is not very severe, so you're not talking a REAL
expensive unit here ...

1286. Boonton 190-A Q meter help

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-05 00:00:00 UTC
From: "Tom Skelton, Jr. (W4iU)" <tskelto@ces.clemson.edu>
Message-ID: <01bd3276$008b49a0$64ca7f82@ece24.ces.clemson.edu>
Source record: 86534

I am reburbing the subject piece of test equipment, and the
power transformer has gone south. Specifically, it's a ferroresonant
transformer spec'ed at 90 -130 VAC input and 115 VAC +/- 1% output.
The secondary voltage no/load measures only about 40 volts, and drops
10 - 15 volts under load.

It appears to have a shorted secondary turn (no primary fuses blow), and
heats up excessively after being on (again, no load) for a couple of
hours.
All components on the secondary side of the transformer check out OK.

Would appreciate any info on a replacement transformer, complete 190-A
meter for sale to use for parts, etc.

Help appreciated. Please email directly to me at:
tskelto@ces.clemson.edu

1288. 1-valve reflex query

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-05 00:00:00 UTC
From: b.h.jarvis@hw.ac.uk
Message-ID: <6bddp6$m7m$1@cn1.hw.ac.uk>
Source record: 86536

Found this 1-valve reflex circuit which is said to be sensitive and selective from LW well into SW; theory escapes me though and I'd welcome comments before spending anything finding the bits not already to hand.

Valve is a DAF91 diode-pentode. Tuning coil is a variometer; 100 turns on 1.5 inch waste-pipe in which swings another 100 turns (in series) on 1 inch overflow pipe. Coils are in series so I can see it has a good range of inductance. In parallel is 350 pF VC so the tuning range doesn't surprise me.

One end of this LC goes direct to the pentode grid; the other end goes to slider of a 1 megohm pot. One end of the pot is earthed; slider is decoupled with 1000 p to earth. Top of pot goes to the diode anode.

Also to the diode anode goes 50 p to the pentode anode.

Pentode load is primary of "a small microphone transformer", between anode and HT+ as you would expect. Secondary (low Z side) goes to speaker or 'phones, 4 to 64 ohm.

Pentode screen is as usual: decoupled R back to HT+.

Aerial is a long wire through 2 pF to pentode grid.

I can see that the selected RF will appear at the anode much amplified, and is applied to the diode anode through the 50 pF. But I'm not clear how the AF appears across the 1 meg pot, ready to go round and be amplified again.

Still, it looks worth a try.

I'd appreciate any theory as to how the detector (demodulator) works. Could it be like a diode pump?

Certainly doesn't look as there is much to go wrong.

I'd go further and say "shouldn't it work with almost ANY RF amplifier valve and ANY diode detector?"

It looks so simple that I'm convinced I must be overlooking something vital.

(Add enough reaction and a carbon mic and I'd think you would have a Tx as well...)

Thanks in anticipation of any helpful comments,

Bill

This is possibly a little-bit off topic but I don't know where else to go.
I want to know how I might build a circuit to connect two serial devices by
InfraRed signals (5-20ft distance). Can I just hook an InfraRed
emitter/detector pair (thru an amplifier) to each serial port (RS232-C) or
do I need a special circuit to make a carrier (like radio) or what?
Thanks,
(Please reply to my address and not just to the list.)

Hi Bob,

Just an interesting story about the importance of checking motor rotation after replacement... I have a friend who works at a pharmaceutical company and he witnessed the maintenance guys wiring the main supply fan to the production line backwards... That is the entire line of flu vaccine was contaminated for the last 6 months and had to be recalled at millions of dollars in costs. M

> Careful...3-500 is a triode......4-400 is a tetrode........you require a
> G2 supply

You can do it...connect the screen grid to the control grid (at the
tube sockets) and run them as triodes. You will probably see a bit lower
output since the 4-400 has lower gain but they will work acceptably
well. And a whole lot less expensive.
Be Careful of tube height, they are a little taller. Don't let the
plate cap short to ground.

This is commonly done with the 4-1000, the '400's big brother, too.

I have the following 20 watt mobile radios for sale:
1-Standard mod# C890l01A, 1channel with 151.625 installed, new in box $100.
1-Standard mod#C890L12A, 12 channel with 8 freqs installed, new in box $150.
1-Standard mod#C890L12A, 12 channel with 8 freqs installed,used $125.
Also have 5@ Standard mod#C830L30 3 channel H.T. with drop chargers and
lots of extras. Need battery packs replaced. Have 151.625 installed, $350.
All of these radios are crystal controlled with seperate rec. and trans
crystals which make them perfect for use as repeaters. Have a 151.625 pager
with drop charger and activator.All have a 138-174mhz range. Will take $575.00
for all the above equiptment.

I've seen guys use a variable DC bias on a toroidal core to modify its
frequency response. If you were to put a few turns on the rod and
apply a DC voltage to it, it might degrade the AL value of the rod,
changing its inductance slightly.

Since rods have that wonderful characteristic of handling large
amounts of current without saturating, a small current should not
affect the coil much, maybe giving you some degree of control using a
digital method of stepping the voltage on the 'bias coil.'

Never tried it with a rod, but it works pretty well with toroids.

I've no idea if this will help!

This one is not all THAT simple, but it looks like a pretty neat project. Page 26.16 of the '96 ARRL Handbook has a digital display grid dip meter. Probably not exactly what you are looking for, but interesting.

>elliston@eisa.net.au

For a first receiver, try the one starting on page 77 in "W1FB's QRP Notebook"
bupblished by the ARRL. The name of the design is "Universal DC Reciever. It
uses the NE-602 active mixer a very popular device in simple radios. Though the
chip has an onboard oscillator, the design takes the better approach of using
an external VFO. There is a single pole op-amp audio filter, but you might want
to build the 4 pole filter described elswwhere in the book if you only want to
hear CW. Parts values are given for 80, 40, 30, and 20 meter bands.

The next project in the book is a very basic superhet, and while it is a bit
ambitious for a first time builder, You might feel up to tackling it after
getting your DC set up and running.

Elsewhere in the book is an extremely simple Regenerative receiver with only
two active devices. Operating such a receiver is not for the faint-hearted or
the easily discouraged. You will be continuously riding the regeneration
control as you listen. Regens are notorious for radiating RF, and so you could
possibly cause interference with your radio. A simple pre-amp ahead of the
front end will prevent this.

All in all, I would suggest the DC receiver for a first project. If you want a
superhet later on, you can use the receiver practically as-is for the
detector/Audio stages byretuning the oscillator to a quiet frequency and
calling it a VFBO, add a simple crystal IF filter, and build another VFO and
mixer. You will want to replace most of the tuning capacitance with fixed value
capacitors to limit the tuning range of the BFO.

This is a good book for the new builder who has more interest in building
something than in learning the finer technical ponts of design. The Author did

not overwhelm the reader with techno-babble, but stuck strictly to the practical aspects of design. You will get a good education in the functions of the basic building blocks, enough to make attempting your own designs possible.

At any good electrical equipment shop.
To erase eproms and mcus I use the Philips G8T5 (8 watts), paid
with its circuitry the equivalent of $10.
Germicidal tubes are used here to sterilize razors and other
things at barber shops, try asking one where did s/he buy it.

And obviously take all precautions before switching it on!

Here's an update on the AM project: I made the circuit changes I planned to in the last post, which had the effect of removing some series inductance and parallel capacitance from the screen circuit in "TUNE" (now AM) mode only, with good results. A friend across town says it sounds like my voice on the air now.

However, it still sounds like I'm providing weak modulation for the carrier envelope I'm developing on voice peaks.

Will anyone who understands the dynamics of screen grid modulation please contact me at mwilson at flex.net? I need to find out how to adjust the one vs. the other. I'm going to try to borrow a scope this weekend so I can look at the signal.

Thanks,
.....Monty.

Hello--
I dimly recall reading a hint published somewhere re: using a
salvaged microwave oven power transformer as a building block for
custom low-voltage transformers. The writer hacksawed away the HV
secondary, leaving the primary untouched, and then determined the core's
turns-per-volt ratio by wrapping a few turns of insulated hookup wire
around the core and measuring the AC voltage produced.
Comments, anyone?

: What would be the best/cheapest device to detect an illegally high amount
: of RF, at an unknown frequency in the UHF or SHF band? The range is less
: than 300 feet. Due to the small wavelength, would they have to be in the
: direct path? How can barrage jamming be used to stop it?

Detecting a watt radiated isotropically at 300 feet away, if there aren't serious obstructions, is quite feasible with just a diode detector. The problem is that if you use an untuned detector, you'll probably pick up all sorts of other garbage, and you won't know what's what. A tuned tank circuit before the detector helps a lot, as does a simple directional antenna once you've found the frequency.

Jamming does not stop radiation. High enough amplitude radiation could possibly interfere with the operation of, or destroy, the equipment generating a signal, however. You might not want to be near anything generating that much...

You aren't the same person that thinks that RF is making file cabinets jump, are you?

Hi Jesse OM,

Any simple or homemade (hack saw blade) key will do fine while you
are getting used
to using CW. However, once you become proficient, you will relegate the
straight
key to the shelf, and use either a bug or electronic keyer (or for some,
a keyboard),
to save unnecessary work while just enjoying conversing with your new
language.
Straight keys are strictly for slower speeds associated with the
period when one "knows
the code", but is not yet proficient enough to use it as just another
language.
Conversational speeds become a lot of (unnecessary) work on a straight
key. One
can send at perhaps 30 wpm with a straight key, but why? A
semiautomatic key is
much more enjoyable to use, HI.
I have been using CW for over 42 years now, and I still treasure my
original J38 key,
but I never use it for ragchewing on the air.

You might want to say what band you want it on. Also whether you want it for voice or Morse.

Both my Novice Notes and QRP websites (URL below) contain extensive information on homebrew transmitters, which types of designs are best, where to find information, links to transmitter circuits and more.

: my KK7B tranceiver project. Any comments from someone who has done this
: would be greatfully received. Failing that info on a stable VFO to cover
: the band would be of interest. Thanks

You sure you can't just use the "zoom" controls on the Acrobat reader to enlarge the fine print? :-) -- of course if the pages are just scanned graphics, you may be out of luck...

Haven't done it, but am contemplating some DDS/PLL projects in connection with my KK7B R2 setup. Those MCL jobs are intended to be locked on frequency in a phase locked loop, so they are probably very marginal as simple voltage tuned VFO's. You would heterodyne the VCO output down to a lower frequency, use a PLL to lock the VCO to an HF VFO or DDS.

Nice compact modules, but you can build better VCO's yourself from a phase noise standpoint -- one of the Ulrich Rohde articles in a QST a few years' back tells you how. Can't place it right now...

1332. WANTED: Ten-Tec HF rig

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-06 00:00:00 UTC
From: k5dh@rtis.ray.com
Message-ID: <6bfbh9$8su@sf18.dseg.ti.com>
Source record: 86561
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I'm looking for a Ten-Tec HF rig, something along the lines
of an Omni-D Series C with all factory upgrades, Corsair I,
Delta, Delta II, etc. CW filter is a MUST, and the more
filters the better. Noise Blanker is desirable too. Don't
need power supply, antenna tuner, or microphone, but I will
consider buying a complete station and selling off the items
I don't need. It's okay if the rig has some minor wear, as
long as it's not bad. I'm not looking for a "museum piece"
to stare at and impress my friends with; I'm looking for a
rig to actually USE on the air (as far as I can tell, from
going on 21 years of hamming, a scratch in the cabinet of a
rig never affects how well it operates, but I may be wrong).
Must have the operating manual (a clean copy is acceptable)
and I'd like to have the service manual too (not a must).

I'm looking to spend no more than US $600, including shipping.

In your first correspondence, tell me the following:
- what rig you have
- what options and accessories come with it
- operating and cosmetic condition
- any damage and/or repair history
- your asking price with shipping.

I will respond to everyone, even if I'm not really interested
in your particular rig. I'd prefer that you email me at home:

mustang_maniac@centuryinter.net

Thanks and 73 in advance!

1333. Re: Motorola HT220?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-06 00:00:00 UTC
From: Jim Devenport <jdport@concentric.net>
Message-ID: <34DB32A0.2B22@concentric.net>
Source record: 86562

Depending on what the original frequency of the HT220 is, all it
requires is crystals for your desired 2 meter frequency and alignment
for maximum RF output and receive sensitivity for that/those
frequencies.
Having done it myself, I would NOT advise it for the following reasons:
1- Crystals are not cheap. 2 are required for EACH frequency you want.
If you buy more than a couple channels worth you are approaching the
cost of a good used synthesized 2 Meter handheld.
2- Batteries are not inexpensive for HT220's.
3- If, by some chance, you think you'd like to use the HT220 for packet,
keep in mind the tx/rx switch is MECHANICAL and must be replaced or
bypassed with a relay to accomplish electronic tx/rx switching. I've
done it, and again, advise against it. Just too little performance for
too much investment in time and money.

Chris, why not have a VXO at 12MHz, the xtals are very cheap and it will save at least a multiplier stage. BTW "Solid State Design for the Radio Amateur" contains a 6 meter project or two... I'll have a look in there if u are interested. HTH

Source record: 86569

I'd like to build a single-frequency FM receiver in the 440 MHz band. I don't need anything very fancy. I've seen that Motorola and others have a wide variety of single chip FM components, presumably for cell phone and other hand held devices, so it seems feasible to build a receiver with a minimal number of parts (assuming you could get the chips in quantities of less than ten thousand...). Before I go off and reinvent the wheel I thought I'd check if anyone already has a design (or good tech note) for such a beast.

thanks!

There's plenty of already assembled fixtures. The F8T5 is a common
lamp for "safari lights", battery powered fluorescent lanterns, or 12
volt fixtures made for recreational vehicles (caravans? in UKspeak)
or at a boat outfitter that specializes in sailboat equipment. The
G8T5 is a drop in replacment with a clear envelope.

OTOH, A while back somebody was posting about good applications notes from
some of the semi companies for electronic ballasts. Motorola, Unitrode?

>G.

The V-G and H-G are the ones you want. They are the vertical and
horizontal inputs. Connect the MARK to the horizontal and SPACE to
the vertical. The only question is whether those inputs are coupled
directly to the CRT deflection plates or through an amplifier. If
they are direct coupled, you may not have enough sensitivity to be
useful. Just try it and see. You should get a pair of crossed
ellipses, but if they're really small you may need to add an external
amplifier.

Source record: 86393
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew

I have the opportunity to pick up a Yaesu FT-301D HF rig at a very attractive price. My interests on HF include the 17 meter and 30 meter WARC bands.

The rig does have a "AUX" position on the band switch, and I would be (reluctantly) willing to give up 15 or 20 Meters. Also a JJY/WWV is on the band switch.

Anyone ever successfully get a FT-301D/S to work on 17M and 30 M? Just a mixer xtal change??

Any constructive input would be appreciated.

Thanks

cc boatanchors@theporch.com
Avo valve tester problem

I've acquired an Avo valve tester in vgc EXCEPT that when the moving coil indicator is off scale either end, the needle bangs itself vigorously and looks as though it's doing damage. You can HEAR it rattling.

I think that MC meter is in a bridge circuit, for comparing actual mA/V with the mfr's figure, which you [the valve tester user] set up before applying HT.

The tester is in 2 boxes. The meter-and-supplies box contains a metal rectifier which has been disconnected and bypassed with a modern sand-state (wash my mouth out) HT rectifier diode.

I can't see ANY smoothing in the HT supply and I wonder whether that is intentional - make sure the needle vibrates violently and audibly so that the user hurries up and gets the thing near balance before any damage is done?

In the unlikely event of that being the intention, to add a fat C would be harmful.

Another possible clue is a spiky soldered joint to one end of the moving coil meter; obviously not how the professionals left it. So maybe there used to be a rectifier bridge for protection, which has been eaten by an earlier vandal?

I'd appreciate comments from anyone who KNOWS, also sensible guesses from fellow amateur detectives.

With thanks in anticimapation,

Bill

GALENA is easy to find, at least in the UK. We have many former lead mines which are now museums. Not surprisingly, you can pick up handfuls of galena as you walk around. The nearest I know to my Edinburgh, Scotland address is well signed from the Motorway M74, the main Carlisle-Glasgow trunk road. The former lead mining village is called Leadhills.

A lady just across the water in the Kingdom of Fife sells specimens of crystals on request but in the case of galena she feels a bit uneasy about it and prefers people to go and pick up their own - which is what I've done - I could post you a lump but of course I could not guarantee it's got just the right impurities to make a good detector for AM.

I could of course salve my conscience by finding you a good "working" lump and charging you for it!

I'm building a hipot tester and am trying to round up the last
few parts for it. Looking for a pair of HV caps with the same
CV ratings for use in a voltage doubler. I can use anything
from .005 uF and up, and need 10kV or 7.5kV units.
(5kV will probably do.) The Glassmike types would be great-
they are tubular, glass, oil-filled with metal end caps and
threaded studs. Probably around 3/4 to 1" dia. and around
2" long. I could also use good quality plastic film types like
the Sprague Vitamin Q's or similar with the same ratings.
I have seen these several times at hamfests when I didn't
need them, and really cheap, of course- Hi! Anyone have a
pair they would be willing to part with, or know of a good
source for reasonably priced surplus? Thanks, 73, David

1364. Radcom 2/98: Delay-Line stabilized oscillators?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-07 00:00:00 UTC
From: LA8ak@direct.Line
Message-ID: <34dccda4.13792196@news.sol.no>
Source record: 86400
Cross-posted to: rec.radio.amateur.homebrew,uk.radio.amateurs

PA0KSB Klaas Spaargaren mentions (see TT: "PA0KSB endorses 'fast' huff &Puff" pp.60-61) delay line oscillators using 15625Hz TV delay line to stabilize VFO in 15.625kHz points. Some simple oscillator circuits has been shown in Radcom, but unfortunately it is difficult to trace the old articles (I have it all stored in wordperfect, and it is difficult to find when using win95)
15.625kHz lock points are not practical to use, except when you multiply the frequency. x16 = 250kHz, x=32 = 500kHz lock-points, so it may be a possibility to build a heterodyne oscillator using this principle instead of buying a large number of xtals to cover the 1.5-30MHz frequency range. MC1496 and S042 has been described for wideband frequency multipliers, one possibly need not build too many bandpass filters to cover the HF range.

any ideas about how stable such delay-line stabilized oscillators might be?

Hey all!

I have an asinine CB'er neighbor with a "pawhr mahk". Her overmodulated commentatry on Clinton, the weather, the power company and the state of her bowels interferes with television reception in a three block radius in our area. She also causes problems with telephones with her closest three neighbors.

Of course, no amount of cajoling will convince this person to turn down her *&^%$@! powered microphone.

I have offered to build her a chebychev filter (I have experience from teenage experimentation with a ramsey radio kit) for her to cut down on this silliness.

Where is a good source for CB filter schema (11 meter? I am neither ham nor CB'er, so be nice! ;-))

This is cross-posted to several groups. Sorry, I am not a regular reader and don't know which is apropriate.

Please email too if it won't be too much trouble!

>IS there a de facto standard?

Contrary to common sense and past usage, the CCIR references the distortion products to the level of either tone--a 6 db hit. Collins (in the past) and the ARRL lab (to this day) correctly reference to PEP. So, the choice is yours but, without a qualification, you would be held to the tighter CCIR standard.

1376. Unassembled Heathkit on eBay

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-08 00:00:00 UTC
From: k2ok@ntr.net
Message-ID: <6bj14r$uem@camel12.mindspring.com>
Source record: 86406

Heathkit IP-2760 Unassembled NEW in the box. Heath called it a "Battery Eliminator". According to the Specifications the output voltage is variable from 7.5 to 15 VDC, Output current is 20 amps intermittent and 12 amps continuous, Output Ripple is less than 1% at full load, Output Regulation is Less than 2% variation from no load to full load. It measures 5-1/4" high x 11" wide x 11" deep and weight is 22.5 pounds. It is still packed in its original box and is complete with Manual. Looks like a really neat kit!

Check it out at:

>http://komodo.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=5770941

baggybobs' buck a bag bargain bonanza brought to you by bob & kim

Surface mount parts for experimenters/prototypers
all new surplus unless otherwise noted

Shipping to the USA
Small parts orders (less than $35 usd). I ship by priority mail. Cost is $3
Larger parts orders I will ship by UPS. Cost is $5
I ship UPS COD only upon receipt of $10 deposit. I cannot afford the
cost or hassle of refused COD shipments.
Really small parts orders (up to $5 surface mount parts only). Send me a
SASE with three stamps. I will put in some foam filler to prevent damage.
International orders require international money order or funds drawn upon
a US bank. We can determine together the best way to ship.
.
If you have tech questions please e-mail. I will answer in a day or two.

A parabolic reflector will just focus the energy to its own feed.
A 90-degree corner reflector is much better, it will send the energy
back to its source. Doesn't even have to be 20 feet. Use that
aluminum foil you have in your hats.

Yes, I've used the 3318, it works well.

However, the A/D is the easy part. You still have to phase lock to the H and V
sync signals (if you can drive the cam with your own H and V sync pulses this
task becomes trivial), make a dual port memory that can handle the fast input,
and provide some way to scan out the image at a slower rate.

Well Douglas, the laws for CB are quite different fron those governing Ham radio. CB radio is limited to 5 watts. Typically CBers who interfere with TV, Stereo etc are running more than the legal output. Hams can legally run up to 1500 watts but generally have enough engineering sense to control spurious outputs that cause TV interference. In my 6 years of operating ham radio, I've NEVER gotten into someones TV, so it is possible to operate without interference. Since this is a CBer the law will be on your side if illegal power levels are used. If this person does not back down on the mike and/or power levels, you should try to solve the problem diplomatically. Most hams would do this. Most CBers don't know what the heck to do. If there is no cooperation, call the FCC. The problem will magically disappear.
In the case of ham interference, hams will usually put a low pass filter on their rig and advise the other person to put a high pass filter on the TV. Go ahead and put a high pass filter on your TV. If this doesn't work, suggest to this person she put a low pass filter on her rig. Again, if there is no cooperation, call Uncle Charlie(FCC).

A quick DejaNews search informed me that this Phil is indeed the person (troll?) who inquired about his neighbors use of high power RF and started a most humorous thread. What tipped it off for me was his hangup on barrage jamming. My whole family enjoyed the "Amana Attack" reply from Bubba.

That's an easy one. Get your Ham Ticket, modify a 10 meter antenna,
get a big amp and blow the front end out of her radio.

So much for all that radio knowledge you need to get a ham ticket......

You'd have much more success with a .357 Mag, Curtis.

Ralph

BWAHHAHAHAHAHAHHAHAAAAA! As I have told some people in email responses, I did actually think about taking the magnetron from the old Amana RadaRange that came with my house, rigging up a wave guide from some old stovepipe and BWWWWWAMMMPP! Instant EMP weapon!

"Thet commie Clinton made my bowells sieze up and made Kentucky lose the big game and... Hey! Mah hahr is on fahr!"

Unfortunately neighborliness calls for forbearance in cases where the offender is not causing me bodily harm or interfering with my livelihood.

I have gotten many helpful and many funny responses from lotsa folks! Thanks for all your help. (And _no_ dammit! I ain't-a tellin' the FCC on her! She is merely interfering with my Simpsons habit, not shutting off my pacemaker! I have this weird thing about not calling in the fuzz at the drop of a hat!)

Thanks again!

I've got some neighbor shooting some type of "pain field generator" at me
and I'm trying to figure out what it is and how to stop it. I got the
local
police to stop over last Wednesday, and I suspect that he has "disappeared"
as the major problems Have stopped. I expect him to come back again, soon.

My Excort Solo radar detector had gone off when he was blasting me with
what ever this is, and that why I suspect the microwave range. I think he
"detuned" it from what ever range this picks up. A number of people have
suggested that this may be a convert microwave oven; I would not be
surprised. So any suggestions of a device or circuit that would pickup and

verify the existance of this, is all I'm trying to build or buy. Then I
will be
looking to build or buy a RF locator to prove that it is coming from this
neighbor. - Thanks - Phil

This is cross-posted to several groups. Sorry, I am not a
>regular reader
and don't know which is apropriate.

Please email too if it
>won't be too much trouble!

Actually, cross-posting is innapropriate because most hams read all the
rec.radio.amateur ngs. They therefore have to wade through yours and others'
cross-posts. Homebrew or equipment are both suitable ngs for posting this,
depending on whether you want to build or buy a filter.

However, nobody is likely to flame you just for asking for help. That is what
most of us are here for. Try the ARRL HANDBOOK, published by the American
Radio Relay League.

http://www.arrl.org

You can try calling the FCC's attention to this obnoxious person (she doesn't sound like a lady to me, unless you were perchance rude to her) but don't hold your breath. It would help to have complaints from a couple dozen different households. If your local TV and Radio stations can lend their weight to your complaints, so much the better. They make money by the number of viewers they have, after all, and they have a somewhat louder voice than you do in DC.

Her overmodulation probably is making her signal exceed spectral limits. She is therefore probably in violation, and unlike a case where interference is not necessarily her responsibility to address, as when the station is operating legally, in this instance the full responsibility DOES legally fall on her. She needs to get her station operating legally to enjoy any protection from your complaints.

Do you know if she is also running an illegal amplifier? This is likely, since the interference covers a fairly large area.

Check and see if she has a ham license, too. If she does, you might get a quicker response. try http://www.qrz.com/cgi-bin/webcall/callbook.html.

Attacking the problem from her end is not your only option. You can do a lot to make your TV, phone, etc more interference resistant. A 50 MHz high-pass filter between your antenna feedline or cable and your TV set might help. The HANDBOOK will tell you more about curing your specific problem.

Try to find a ham in your area who has had to deal with your neighbor's interference. You may even have to ask nicely to your CB neighbor if any hams have came around offering their help. Hope you haven't burned that source of information! You will need to establish some sort of rapport with her if you are to resolve the interference problem in a non-bureaucratic way.

One other thing to try is the clamp-on toroid chokes sold at Rat Shack. Put them on your power cords close to the affected sets' cases. Also, try a highly directional antenna and point it away from your CBer's antenna. The antennas that have a lot of parallel elements on a boom, with the shorter ones toward one end are good for this. This is the Log-periodic type antenna and it recieves best those stations pointed at with the boom, shorter element foremost.

This is really dirty pool, but you might check to see if there are any codes, covenants, or restrictions on antennas or antenna heights. If the CB woman is exceeding these, you can get action on a local level, possibly.

Hams sometimes have "antenna parties", especially for elderly or disabled hams, where everybody gets together and lends a hand erecting an antenna. I have heard also of "reverse" antenna parties. I don't advocate this type of direct action, because it could get you into trouble. That's all I got to say about THAT.

Good luck. Hope this helps.

I unserstand that the batteries made for the Polaroid film packs--The very light, flat Alkaline 6 volt, that powers the cameras that "spit out" pictures, can be obtained from the manufaturer. I need some for a special project. Polaroid Sells them for $5.50 each, but the manufacturer sells them (I was told) for $1.50 if purchased in lots of 90. Does anyone know the maker of this battery? I was told a company called " Powercard Inc.", but can't find any info on them. Can you help? Thanks in advance for your help!

Maybe a TV to detect the presence of UHF before jumping into the realm
of "malicious interference"?

I'm reminded of my former neighbor who was convinced that my
intermittent transmissions on 147 MHz was causing his continuous
interference with VHF-L (around 50 MHz). Turns out he had neglected
to attach both wires from the antenna to his TV.

Hmm I am getting a bit confused!
Fred you say ARRL goes for PEP and Gary says they do not....

Well, if I recall correctly the pix in QST usually shows PEP when
measuring transmitters, but how do ARRL measures receivers?

Maybe an index that shows how the measurement was done? IP3INPEP or
something but when referring to one tone, the question arises, have
the index been forgotten or is it a measurement w.r.t. a single tone??

OK I give up. From now on I *will* use the single tone as a reference,
but what happens when I start playing with A/D's?..... (everybody
seems to have the two tones set at fullscale - 7dB)

If the received signal is a two-tone signal, then the important question is the level of distortion below the two actual signals that are actually being received. The PEP level itself is not an actual signal, the two tones are the two signals that are being delivered to the loudspeaker. This is the reason that Collins has always used the distortion level below ech of the two tones as a criterion.

This same idea applies also to the transmitted signal.

Basically to the Nyquist frequency, although it starts getting ratty at about
20 - 21 MHz. You can, if you realize what you're doing and can live with it
(used as a signal generator in a filter environment sort of thing), use it
above Nyquist.

I have since found that Maplins sell a 4W UV tube for 20UKP and a small
lantern with a 4W tube for 5UKP. Maybe this is the way to go, I haven't
got the UV tube yet as I am hoping to find one a bit cheaper.

What I am interested in is the time taken to erase an EPROM, I understand
there is no damage if you leave it in a little too long but what is the
expected time for erasure if I use a 4W tube?

Thanks,
Dave.

Geert, voor zover ik weet is een MAR-6 een MMIC, een 4-potige breedband (0-1GHz) versterker, 50 ohm in/uit. Iemand anders heeft een minicircuits web-page URL gegeven, daar zul je allicht meer informatie kunnen vergaren. Ik zou alleen geen idee hebben waar men zoiets kan kopen in belgie (hier in Engeland is dat geen probleem!). HTH

Now THAT is a good idea, for a last resort. Do try "nicer" methods first,
though, and remember, don't rub it in. And use a very high gain antenna,
carefully aimed, taking care not to light up any innocent bystanders with legal
limit through a 15 element yagi! It might be a good idea to use the same
polarization as the CBer, i.e. vertical or horizontal. Don't give up on the
more civilized methods though, until you give them a chance to work.

If you haven't seen it yet, 73 Magazine had an article on this
around 1990. Sorry, I don't have the reference.

Seems that the microwave diode is loud enough to serve as
a transmitter on 10 GHz, so the receiver is also the transmitter.

Has anybody here ever actually gotten Uncle Charlie to move on a CB violation (or any other violation for that matter)? It calls to mind the dope dealers in Oakland CA who used to run humongous, band-splattering linears on CB ch. 6 back in the '80s. Many calls, petitions and faxes to the agency were to no avail and the problem went on for 4 years that I know of, before junking my CB rig. Anybody in the Bay Area listening to ch. 6 these days?

UV tubes from Service Trading Co. in Chiswick are a lot cheaper. They
also sell kits which include most of the bits you need.

REPLY...

Sadly, contrary to the opinions of others in this thread, it is darn easy for an unmodified, stock, CB radio to cause interference with the neighbor's telephone and television.

If you complain to the FCC, they will send you a simple guidebook explaining how to solve common interference problems. They will not get involved beyond that unless it can be demonstrated that illegal radio equipment is being used by the offending party.

To save you the effort of sending for the book, it simply says to fix the problem yourself by installing filters on your television and telephone (Radio Shack). It recommends that the CBer also install filters on their radio, but does not require this.

It also talks about insuring that your television cable, and telephone lines, are properly grounded. It also recommends that the CBer's radio gear be grounded (again, it does not require this).

The FCC's position is that many interference problems are caused by poorly designed telephones and televisions. Therefore , any radio will potentially cause problems. They have demonstrated that a well-designed, stock, CB can cause problems with poorly designed consumer electronics (which they feel means most of the stuff on the market today).

So, in the end, their basic position is, work with the CBer to solve the problem. If you would like a free copy of the guidebook, contact the FCC at one of the numbers already listed in this thread.

Which would require someone driving from Chicago (closest field office? I think so...) to Evansville to inspect one late-middleaged rachet-jaws (remember Rachet-Jaw? There's a song about Rachet-Jaw (-:) cheese-eating CB! Not an effective use of gubmint funs if you ask me. (If they could get the local FM stations to quit overmodulating in their ratings battles....)

1419. Help on receiving a specific VHF freqeuency

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-09 00:00:00 UTC
From: cds@wang.co.nz
Message-ID: <887079768.753205260@dejanews.com>
Source record: 86449

Hi All

I'm hoping that somebody can help me. I'll explain the total situation so that you understand where I'm coming from.

I have a brother who's a helicopter pilot and he wants a way of switching on the landing lights at his airfield late at night. He wants to be able to trigger some device to turn on the lights from (say) 500 metres away.

I thought that the best way to do this would be to transmit a code on a specific frequency from the helicopter's radio, and have a receiver at the airfield to pick up and detect the code, thus turning on the lights for a certain time.

Doing the electronics to do the code detection, switching etc. is not a problem for me - the radio side is though.

Firstly, I understand that the radio transmits on VHF from about 118MHz - 134MHz (or thereabouts). I don't know whether it transmits FM, SSB or whatever. Can anyone help me with this?

Secondly, I need to either build a receiver, or modify an existing receiver to receive a freqeuency that the helicopter's radio can transmit. Would it be possible to modify a domestic FM receiver, plug in a crystal cut to the right frequency, and use that? Given that the range is not great, I would think that this might prove an easy way to do it. Failing that, are there any simple receiver designs that would handle the situation that I'm describing.

Well, that's it. If you can help me, I'd love to hear from you. Please email you reply as I'm posting this via deja-news.

From 500 meters, you can probably just use a NOISE detector.

If the helicopter has a "headlight", use a light detector.

If you're dead-set on using a radio, how about a garage door opener? There are some X10 radio remote light switches. Can probably still get them at radio shack. Car alarm transmitter...

Messing with the helicopter radio is ill-advised if not illegal.

Just an FYI...
Many CB'ers forget that these rules are still in the books..

_____
Title 47 - Telecommunication
Chapter I - Federal Communications Commission
Part 95 - Personal Radio Services
Subpart D - Rules for CB Service
Revised as of October 1, 1996

Citizens Band (CB) Radio Service

<RULE 1> Description
<RULE 2> Usage of Rules
<RULE 3> Who is Eligible
<RULE 4> Licenses
<RULE 5>Areas Of Legal Operation
<RULE 6>Special Restrictions
<RULE 7>Operating Channels/Frequencies
<RULE 8>Antenna Height
<RULE 9>Equipment
<RULE 10> Power Output
<RULE 11> Linear Amplifiers
<RULE 12> Permitted Communication
<RULE 13> Illegal Communication
<RULE 14> Paying for Actual Use
<RULE 15> Who Is Held Accountable
<RULE 16> Time Limit of Transmissions
<RULE 17> Identification Methods
<RULE 18> Emergency Usage and Assisting Travelers
<RULE 19> Remote Control Operations
<RULE 20> Telephone Patches and Telephony with CB
<RULE 21> Penalties
<RULE 22> Correspondence from FCC
<RULE 23> Notice of Interference
<RULE 24> Service to Transmitters and Antennas
<RULE 25> Modifications to Transmitters
<RULE 26> FCC Inspections
<RULE 27> Keeping Station Records
<RULE 28> Contacting the FCC

Rule 1 - Description

Citizen's Band Radio Service (CB) is a private, two-way, short-distance
voice communications service for personal or business

activities. The CB Radio Service may also be used for voicepaging.

Rule 2 - Usage of Rules

You must comply with these rules when you operate a station in the CB Service from:
{1} Within or over the territorial limits of places where radio services are regulated by the FCC.
{2} Aboard any vessel or aircraft registered in the United States or
{3} Aboard any unregistered vessel or aircraft owned or operated by a United States citizen or company.

Your CB must comply with Part 95/Subpart E [Technical Rules].

Where the rules use the word "you", "you" means a person operating a CB station. Where the rules use the word "person" the rules are concerned with an individual, a corporation, a partnership, an association, a joint stock company, a trust, a state, territorial or local government unit, or other legal entity. Where the rules use the term "CB station", that means a radio station transmitting in the CB Radio Service.

Rule 3 - Eligibility To Use CB

You are authorized to operate a CB station unless:
{A} You are a foreign government, a representative of a foreign government, or a federal government agency. or
{B} The FCC has issued a cease and desist order to you, and the order is still in effect.

Rule 4 - Licenses

You do not need an individual license to operate a CB station. You are authorized by this rule to operate your CB station in accordance with the rules stated in this Subpart. <*also read Rule 17>

Rule 5 - Areas of Legal Operation

You are authorized to operate your CB station from:
{A} Within or over any area of the world where radio services are regulated by the FCC.
Those areas are:
[1] The 50 United States
[2] The District Of Columbia
[3] Commonwealth of Puerto Rico
[4] Navassa Island
[5] United States Virgin Islands, it's 50 islets and cays
[6] American Samoa
[7] Baker Island
[8] Commonwealth of Northern Mariana Islands
[9] Guam Island
[10] Howland Island
[11] Jarvis Islad

[12] Johnston Island
[13] Kingman Reef
[14] Midway Islad
[15] Palmyra Island, and it's 50+ islets
[16] Wake Island

{B} Any area of the world, except, within the territorial limits of areas where radio services are regulated by -
[1] An agency of the United States other than the FCC, you are subject to it's rules.
[2] Any foreign government, you are subject to it's rules.

{C} An aircraft or ship, with the permission of the captain, within or over any area of the world where radio services are regulated by the FCC or upon or over international waters. You must operate your CB station according to any applicable treaty to which the United States is a party.

Rule 6 - Special Restrictions

{A} If your CB station is located on premises controlled by the Department of Defense you may be required to comply with additional regulations imposed by the commanding officer of the installation.
{B} If your CB station will be constructed on land of environmental or historical importance (such as a location significant in American history, architecture or culture), you may be required to provide information to comply with Part 1.1305 through 1.1319 of the FCC Rules.

Rule 7 - Operating Channels/Frequencies

Your CB station may transmit only on the following channels/frequencies:

channel frequency(Mhz)
channel frequency(Mhz)
1 26.965
21 27.215
2 26.975
22 27.225
3 26.985
23 27.255
4 27.005
24 27.235
5 27.015
25 27.245
6 27.025
26 27.265
7 27.035
27 27.275
8 27.055
28 27.285

9* 27.065
29 27.295
10 27.075
30 27.305
11 27.085
31 27.315
12 27.105
32 27.325
13 27.115
33 27.335
14 27.125
34 27.345
15 27.135
35 27.355
16 27.155
36 27.365
17 27.165
37 27.375
18 27.175
38 27.385
19 27.185
39 27.395
20 27.205
40 27.405

{B} * Channel 9 may be used ONLY for emergency communications OR for traveler assistance.
{C} You must, at all times and on ALL channels, give priority to emergency communication messages concerning the immediate safety of life or the immediate protection of property.
{D} You may use ANY channel for emergency communications or for traveler assistance.
{E} You must share each channel with other users.
{F} The FCC will not assign any channel for the private or exclusive use of any particular CB station or group of stations.
{G} The FCC will not assign any channel for the private or exclusive use of CB stations transmitting single sideband or AM.

Rule 8 - Antenna Height

{A} "Antenna" means the radiating system (for transmitting, receiving or both) and the structure holding it up (tower, pole or mast). It also means everything else attached to the radiating system and the structure.
{B} If your antenna is mounted on a hand-held portable unit, none of the following limitations apply;
{C} If your antenna is installed at a fixed location (whether receiving, transmitting or both) it must comply with EITHER one of the following:
[1] The highest point must not be more than 20 feet (6.10 meters) higher than the highest point of the building or tree on

which it is mounted; or
[2] The highest point must not be more than 60 feet (18.3 meters) above the ground.
{D} If your CB station is located near an airport, and if your antenna structure is more than 20 feet (6.10 meters) high, you may have to obey additional restrictions. The highest point of your antenna must not exceed 39.37 inches (1 meter) above the airport elevation for every 109.36 yards (100 meters, 1 hectometer) of distance from the nearest point of the nearest airport runway.
Differences in ground elevation between your antenna and the airport runway may complicate this formula. If your CB station is near an airport, you may contact the nearest FCC field office for a worksheet to help you figure the maximum allowable height for your antenna. WARNING: Installation and removal of CB station antennas near powerlines is dangerous. For your safety follow the installation directions included with your antenna.

Rule 9 - Equipment

{A} You must use an FCC type accepted CB transmitter at your CB station. You can identify an FCC type accepted transmitter by the 'type acceptance' label placed on it by the manufacturer. You may examine a list of type-accepted equipment at any FCC Field Office or at FCC Headquarters. Use of a transmitter which is not FCC type-accepted voids your authority to operate the station.
{B} You must not make, or have made, any internal modifications to a type-accepted CB transmitter. <*read Rule 25> Any internal modification to a type-accepted CB transmitter cancels the type-acceptance, and use of such a transmitter voids your authority to operate the station.

Rule 10 - Power Output

{A} Your CB station transmitter power output must not exceed the following values under any conditions: AM [Amplitude Modulation] - 4 watts carrier power [CP] SSB [Single Side-Band] - 12 watts peak envelope power [PEP]
{B} If you need more information about the power rule, see Part 95/Subpart E.
{C} Use of a transmitter which has carrier [CP] or peak envelope power [PEP] in excess of that authorized voids your authority to operate the station.

Rule 11 - Linear Amplifiers

{A} You may not attach the following items (power amplifiers) to your type-accepted CB transmitter in any way:
[1] External radio frequency [RF] power amplifiers, also called linear amplifiers, or linears; or
[2] Any other devices which, when used with a radio transmitter as a signal source, are capable of amplifying the signal.

{B} There are no exceptions to this rule and use of a power amplifier voids your authority to operate the station.
{C} The FCC will presume you have used a linear or other external [RF] power amplifier if-
[1] It is in your possession or on your premises; and
[2] There is OTHER EVIDENCE that you have operated your CB station with more power than allowed by CB Rule 10.
{D} Paragraph C above in this section does not apply if you hold a license in another radio service (HAM, etc.) which allows you to operate an external RF power amplifier.

Rule 12 - Permitted Communications

{A} You may use your CB station to transmit two-way plain language communications. Two-way plain language communications are communications without codes or coded messages. Operating signals such as "ten codes" (10-4, etc.) are not considered codes or coded messages. You may transmit two-way plain language communications only to other CB stations, to units of your own CB station, or to authorized government stations on CB frequencies about-
[1] Your personal or business activities, or those of members of your immediate family living in your household;
[2] Emergencies;
[3] Traveler assistance;
[4] Civil Defense activities in connection with official tests or drills conducted by, or actual emergencies announced by, the Civil Defense Agency with authority over the area in which your station is located.
{B} You may use your CB station to transmit a TONE SIGNAL only when the signal is used to make contact, or to continue communications (Examples: tone operated squelch, selective calling circuits). If the signal is an audible tone, it must last no longer than 15 seconds at one time. If the signal is a subaudible tone, it may be transmitted continuously only as long as you are talking.
{C} You may use your CB station to transmit one-way communications (messages not intended for two or more CB stations) only for emergency communications, traveler assistance, brief tests (radio checks) or voice paging.

Rule 13 - Illegal Communications

{A} You must NOT use a CB station-
[1] in connection with activity which is against federal, state or local law;
[2] to transmit obscene, indecent or profane words, language or meaning;
[3] to interfere intentionally with the communications of another CB station;
[4] to transmit one-way communications, EXCEPT for emergency

communications, traveler assistance, brief tests (radio
checks) or voice paging;
[5] to advertise or solicit the sale of any goods or services;
[6] to transmit music, whistling, sound effects or any material to
amuse or entertain;
[7] to transmit any sound effect solely to attract attention;
[8] to transmit the word "MAYDAY" or use any other international
distress signal, EXCEPT when your station is located in
a ship, aircraft or other vehicle which is threatened with GRAVE AND
IMMINENT danger and you are requesting
IMMEDIATE assistance.
[9] to communicate with, or ATTEMPT to communicate with, any CB
station more than 155.3 miles (250 kilometers)
away
[10] to advertise a political candidate or political campaign (You may
use your CB radio for the business or organizational
aspects of a campaign, if you follow all other applicable rules);
[11] to communicate with stations in other countries, except stations
in Canada (on General Radio Service).
[12] to transmit a false or deceptive communication.
{B} You must not use a CB station to transmit communications intended for
live or delayed rebroadcast on radio or television.
You may use your CB station to gather news items or to prepare programs.

Rule 14 - Paying for Actual Use

{A} You may not accept direct or indirect payment for transmitting with a CB
station.
{B} You may use a CB station to help you provide a service, and be paid for
that service, as long as you are paid only for the
service and not for the actual use of the CB station.

Rule 15 - Who Is Held Accountable

You are responsible for all communications which are made BY YOU from a CB
station.

Rule 16 - Time Limit of Transmissions

{A} You must limit your CB communications to the minimum practical time.
{B} If you are communicating with another CB station or stations, you, and
the stations communicating with you, must limit each
of your conversations to no more than five (5) continuous minutes.
{C} At the end of your conversation, you, and the stations communicating
with you, must not transmit again for at least one
minute.

Rule 17 - Identification Methods

{A} You need NOT identify your CB communications...
{B} You are ENCOURAGED to identify your CB communications by any of the
following means:
[1] Previously assigned FCC CB call sign

[2] K prefix followed by operators initials and residence zip code
[3] Your name; or
[4] Description of your organization including name and any applicable operator unit number
{C} You are encouraged to use a "handle" (nickname) ONLY IN CONJUNCTION WITH the methods of identification listed above in paragraph B of this section.

Rule 18 - Emergency Usage and Assisting Travelers

{A} You must at all times and on all channels, give priority to emergency communications.
{B} When you are directly participating in emergency communications, you do not have to comply with Rule 16 about length of transmissions. You must obey all other rules.
{C} You may use your CB station for communications necessary to assist a traveler to REACH A DESTINATION or to RECEIVE NECESSARY SERVICES. When you are using your CB station to assist a traveler, you do not have to obey Rule 16 about the length of transmissions. You must obey all other rules.

Rule 19 - Remote Control Operations

{A} You MAY NOT operate a CB station transmitter by RADIO remote control.
{B} You MAY operate a CB transmitter by WIRELINE remote control IF you obtain specific approval in writing from the FCC. To obtain FCC approval you must show why you need to operate your station by wireline remote control. Send your request and justification to: FCC, Gettysburg, PA 17325. If you receive FCC approval, you must keep the approval as part of your station records (read Rule 27 on station records).

Rule 20 - Telephone Patches and Telephony with CB

{A} You MAY connect your CB station transmitter to a telephone if you comply with ALL of the following:
[1] You or someone else must be present at your CB station and MUST-
(i) manually make the connection (the connection cannot be made by remote control);
(ii) supervise the operation of the transmitter during the connection;
(iii) listen to each communication during the connection; and
(iv) stop all communications if there are operations in violation of these rules.
[2] Each communication during the telephone connection must comply with all of these rules.
[3] You must obey any restriction that the telephone company places on the connection of a CB transmitter to a telephone.
{B} The CB transmitter you connect to a telephone must not be shared with any other CB station.
{C} If you connect your CB transmitter to a telephone, you must use a phone patch device which has been registered with the

FCC.

Rule 21 - Penalties ++may not be current penalty information.

{A} If the FCC finds that you have WILLFULLY or REPEATEDLY violated the Communications Act or FCC Rules, you
may have to pay as much as $2,000++ for each violation, up to a total of $5,000++.
{B} If the FCC finds that you have violated any section of the Communications Act or FCC Rules, you may be ordered to stop
whatever action caused the violation.
{C} If a federal court finds that you have WILLFULLY and KNOWINGLY violated any FCC Rule, you may be fined up to
$500++ for each day you committed the violation.
{D} If a federal court finds that you have WILLFULLY and KNOWINGLY violated any provision of the Communications
Act, you may be fined up to $10,000++ or may be imprisoned for one year++, or both++.

Rule 22 - Correspondence from FCC

{A} If it appears to the FCC that you have violated the Communications Act or these rules, the FCC may send you a
discrepancy notice.
{B} Within the time period stated in the notice, you must answer with:
[1] A complete written statement about the apparent discrepancy;
[2] A complete written statement about any action you have taken to correct the apparent violation and to prevent it from
happening again; and
[3] The name of the person operating at the time of the apparent violation.
{C} If the FCC sends you a letter asking you questions about your CB radio station or its operation, you must answer each of
the questions with a complete written statement within the time period stated in the letter.
{D} You must not shorten your answer by references to other communications or notices.
{E} You must send your answer to the FCC office which sent you the notice.
{F} You must keep a copy of your answer in your station records.

Rule 23 - Notice of Interference

{A} If the FCC tells you that your CB station is causing interference due to technical reasons, you must follow all instructions in
the official FCC notice (This notice may require you to have technical adjustments made to your equipment).
{B} You must comply with any restricted hours of CB station operation which may be included in the official notice.

Rule 24 - Service to Transmitters and Antennas

{A} You may adjust an antenna to your CB transmitter and you may make radio checks (One-way transmissions for a short

time in order to test the transmitter).
{B} Each internal repair and each internal adjustment to your FCC type-accepted CB transmitter must be made BY or under the DIRECT SUPERVISION of a person licensed by the FCC as a GENERAL RADIOTELEPHONE OPERATOR.
{C} Except as provided in paragraph D below in this section, each internal repair and each internal adjustment of a CB transmitter in which signals are transmitted must be made using a NONRADIATING antenna (Dummy Load).
{D} Brief test signals (signals not longer than one minute during any five minute period) using a radiating antenna may be transmitted in order to:
[1] adjust an antenna to a transmitter;
[2] detect or measure radiation of energy other than the intended signal; or
[3] tune a receiver to your CB transmitter.

Rule 25 - Modifications to Transmitters

{A} You must not make or have any one else make any internal modification to your CB transmitter.
{B} Internal modification does NOT include:
[1] Repair, or servicing of a CB station transmitter; or
[2] Changing plug-in modules which were type-accepted as part of your CB transmitter
{C} You must not operate a CB transmitter which has been modified by anyone in any way, including modification to operate on unauthorized frequencies or with illegal power.

Rule 26 - FCC Inspections

{A} If an authorized FCC representative requests to inspect your CB station, you must make your CB station and records available for inspection.
{B} A CB station includes all of the radio equipment you use.

Rule 27 - Keeping Station Records

Your station records include the following documents, as applicable:
[1] A copy of each response to an FCC violation notice or an FCC letter.
[2] Each written permission received from the FCC.

Rule 28 - Contacting the FCC

{A} Write to your nearest FCC Field Office to:
[1] Report an interference complaint; or
[2] want to know if the FCC has type-accepted a particular transmitter for CB service.
{B} Write to the FCC if you have questions about the CB Rules: FCC Private Radio Bureau Personal Radio Branch
Washington, DC 20554

1424. Re: UV PROM eraser bulb found cheap

> ... snip ...
> What I am interested in is the time taken to erase an EPROM, I understand
> there is no damage if you leave it in a little too long but what is the
> expected time for erasure if I use a 4W tube?

this is from cypress semi. cmos/bicmos databook, 'intro to cmos proms'
p.3-2 ,
5: erasability
wavelengths of light less than 4000 angstroms begin to erase cypress
proms.
for this reason, an opaque label should be placed over the window if the
prom is exposed to sunlight or fluorescent lighting for extended periods
of time.
the recommended dose of ultraviolet light for erasure is a wavelength
of 2537 angstroms for a min. dose (UV intensity x exposure time) of
25 Wsec/cm^2. for an ultraviolet lamp w/ a 12 mW/cm^2 power rating
the exposure time would be approx. 30-35 minutes. the industry eprom
erasure standard is 15 Wsec/cm^2. cypress eproms require 1 2/3 longer
rease times.

the prom needs to be within 1 inch fo the lamp during the erasure.
permanent damage may result if the prom is exposed to high intensity
light for an extended period of time. 7258 Wsec.cm^2 is the
recommended maximum dosage. '

greetings
Many years ago, I took apart my old dx-60. I semi regret that
decision now, but that is in the past.
Recently, I found the plate/grid meter and would like to use the meter
in other projects. I realise I could use simple ohms law and try to
figure out what the parallel resistors should be to match the from
panel current ratings, however does anyone have a copy of the manual
who could tell me what the parallet resistor values are?

This is called PCL, in pilot language: pilot controlled lighting. Quite common at uncontrolled airfields. 7 clicks gets hi intensity, 5 clicks medium, 3 clicks lo intensity. clicking the mic button those number of times within a second or so will activate the light timer. the lights remain "on" for 15 minutes.

some sort of "click" decoder (some 7400 series logic) will determine the proper lite intensity mode. all connected to an rx at the proper freq. the clicks will break the receiver squelch, and activates the AGC. this can be detected by the 4000cmos logic or the 7400 series logic.

>Fred you say ARRL goes for PEP and Gary says they do not....

Gary isn't often wrong, but he is about the ARRL. On pg. 63 of the November 1997 QST look at Figure 4 at the top of the page. You'll clearly see that each sideband is situated at -6 db so that (if the two tones are equal) the distortion is automatically referenced to the PEP output of the transmitter. (My mind may be going with advancing age but I seem to remember my Collins S-Line & my Rockwell KWM-380 having different distortion product references; Sabin says they've been consistent. And he's rarely wrong whereas I often am.)

Look, let's agree that what we're trying to do is get some measure of the linearity of the amplifying device. You can argue that it really doesn't matter whether you use PEP or either tone's level as long as you are consistent. PEP, for some reason that escapes me, is a difficult concept to grasp. Because PEP was too hard to grasp by the boys writing the CCIR spec., they decided that the reference would be the amplitude of either of two equal tones. Easy. And wrong in the sense that you are measuring the amplitude of the distortion with reference to a signal that is 6 db below the output power of the amplifier at the time the test is run.

If you think this argument is new, find an old copy of "Care and Feeding of Power Grid Tubes." They clearly specify that the "standard" way of specifying distortion products is to use one tone of a two-tone signal as reference. And you can tell from the way the author uses emphasis that he's trying to refute some other reference.

So, in conclusion, insofar as transmit IMD is concerned, ARRL is right, CCIR is wrong. I have logic on my side. Which probably dooms my case.

This sort of system is quite common at small airfields here in the U.S. Most uncontrolled airports use a common frequency for giving traffic advisories to incoming aircraft (such as 122.8 mHz)... typically employing a low-power (5 to 10 watt) single-channel tranceiver located at the airport office.

There are several avionics manufacturers (King, Narco, Standard etc.) who sell pilot-controlled-lighting adaptors. These decoders are wired in parallel with the tranceiver's speaker output.

If the pilot of an incoming aircraft wants to turn on the runway lights, he will simply key his microphone a certain number of times within a given time frame (typically 5 "clicks" within 10 seconds) transmitting on the common advisory frequency. When the ground-based decoder detects the appropriate keying pattern, it will energize a relay, turning on the runway lights. (The lights automatically switch off after a few minutes).

This system allows small airfields to remain open to landing aircraft at night after the staff has gone home, while at the same time avoiding large electric bills, (since the runway lights are only illuminated on an "as needed" basis). The decoders are relatively inexpensive, and are available from almost any vendor which sells aircraft supplies or avionics.

One big advantage of this system is that it requires no special equipment in the aircraft other than the standard VHF communications radio.

You could indeed home-brew a decoder to perform this function, but the price would probably come out about the same as what one of the commercial units would cost.

Regards,

Jim Barrett

Sorry this text is translated with the computer

Hi,

I would build for my ship (steel sailboat) one SSB antenna . On the
eightstay I have not good experiences.
It gives in the ship accessory SSB antennae those are approx 4 to 6 m of 1,6
to 24 MHZ long the entire maritime mobile service field and for the entire
maritime mobile service field
Now my question:
Since these antennae cost approx 600 DM would like to build themselves.
Where I can find a manual?

Klaus

Bought a used Dentron 160-10 Super Tuner and found the band switch was
a crispy critter. Not Nice.. Need a single pole 12 position or 11
position HEAVY DUTY rotary band switch to replace the afore mentioned
piece of burnt junk. The original was so small it belonged in a QRP
tuner not one rated for 1KW PEP. Got anything perhaps military
surplus collecting dust on the shelf you would like to part with
cheep? Got plenty of room in the box for anything up to 3 1/2 inches
in diameter with a 1/4 inch shaft.
Thanks in advance to the group....
Mike Baker K0QZ/7 k0qz@primenet.com
Phoenix, AZ.

I go for this option it is the only way to go.

> It also talks about insuring that your television cable, and telephone
>lines, are properly grounded. It also recommends that the CBer's radio
>gear be grounded (again, it does not require this).

Grounding of any radio will not always work out as the distance of the good
RF ground might be too far away to be effective.

> The FCC's position is that many interference problems are caused by
>poorly designed telephones and televisions. Therefore , any radio will
>potentially cause problems. They have demonstrated that a
>well-designed, stock, CB can cause problems with poorly designed
>consumer electronics

Any radio transmitter Ham or CB even police, paging services, fire or any legal user can cause interference with poorly designed comsumer electronics.

> (which they feel means most of the stuff on the market today).

> So, in the end, their basic position is, work with the CBer to solve

The voltage is a bit low for temperature compensation circuits though
some 10MHZ TCXOs are available.
>ma up to 50 availible from supply
You will have to use a TCXO as the power is insufficient for an Ovened
Crystal oscillatoe OCXO
PS Some vacuum insulated OCXOs will meet this but are hundreds of $
>temp +65f to +115f
No problem
>freq 10.0mhz + or - 10hz should be trimable to 10.0 exactly.
All TCXOs come with adjustment to allow for correction of the frequency
for aging typically 2ppm/year.
>
>
> Does anything exist out there to do this. Think of it as a
>freq counter time base for extremely acurate counter.
Buy a TCXO you may find one @ 5V but will be cheaper at 9/12V

: to do. Does anyone have a source to modify either of these
: transceivers? I am interested in hearing from anyone who has
: successfully done so. Randy AB7QR

Except in an emergency, even a license for marine band useage will not
legally allow use of a modified ham unit.
Legal marine units need type acceptance, and the ham unit would not have
this.
I still think that you should do the mods anyway-in a emergency, it could
be a lifesaver, but to be legal, you should still use your type accepted
marine unit under normal circumstances.
Of course, unless the FCC actually LOOKS at your equipment, they will not
be able to tell the difference between the 2 radios.

AM is used for aircraft radios in this range.

> Secondly, I need to either build a receiver, or modify an existing
> receiver to receive a freqeuency that the helicopter's radio can

First off, there may be some legalities about what frequency you want
to use. I'm not so sure that you can just pick an unused frequency in
the AM COM band and do whatever you want there.
The alternative would be to stay out of the AM COM band and use
something in the 138 - 174 MHz FM range using a low power transitter.

Check the Motorola communications databook...they have application
notes on their transmitter and receiver chips. Or check with Ramsey
Electronics (NY). They have cheap and dirty tranmsitter and receiver
kits.

>
>
(from memory thinking at the keyboard!)The bulk acoustic wave delay line
has a delay presumably corresponding to 1/15.625kHz which will be the
period of one line. The Delay line has a approx 5Mhz bandwidth and
operates / is centered at the IF frequency. The phase across the delay
line will change 360 degrees every 15.625 kHz in the pass band.
An oscillator will be fairly straight forward and should consist of an
amp with 15?db gain to offset the line loss and be sufficiently
selective ie have a hi Q tuned cct (100 to 300)that you can tune across
the pass band of the line. As the tuned circuit is tuned across the band
the frequency will jump in 15khz steps.
The hi Q requirement of the line implies that a fractional drift/shift
in the tuned circuit will pull the frequency approx 1/3 and the line 2/3
the line is made of isopaustic glass with very good TC but overall there
may be more drift from the maintaining circuit.

From: Don McPherson <bjmcpher@usit.net>
Message-ID: <34E0ACEE.FAAA84F1@usit.net>
Source record: 86482

Can anyone tell me the basic theory behind resonant power transformers?
What are the practical considerations, and advantage and disadvantages?
I've acquired a battery charger rated at 36 volts and 20 amps dc. It
seems to work, but since I dont use three series batterys for anything,
I'm thinking of adding a large smoothing capacitor, and using it as a
heavy duty power supply.The transformer appears to be a normal tapped
secondary type, but it has one additional winding of fine wire which is
only connected to a high voltage cap. This winding appears to operate at
about 700 volts. Thanks for any theory or suggestions.
Don

Hi Bill, (and others)

Note that the 1997-98 catalogue carries the warning
"The polyvaricon capacitor in this kit is no longer available,
therefore this kit will be supplied without it"

This is a dual-gang 250+250pF variable.

The RSGB book "The antenna experimenter's guide" by Peter Dodd G3LDO
suggests that the best simple designs that he has seen are based on
those published in Technical Correspondence in QST in June 1972 and
November 1971.

Gruss Gott, Herr Woellenweber,

It was your name that caught my attention. Years ago I worken on a
project for the US Government. That project included some large
antennas built in Germany. The antennas had the appearance of a
knitting machine - hence they were called "Woellenweber".

>I would build for my ship (steel sailboat) one SSB antenna . On the
>eightstay I have not good experiences.
Ich verstehe nicht "eightstay". Das muss eine falsche Uebersetzung
sein.

I know of amateurs who have used the "backstay" as an antenna. (d.h.,
the steel cable that runs from the Stern (of the boat - nicht Sternen
wie im Himmel) up to the top of the mast. They have reported very
good results. The steel hull of your boat will enhance a "ground
plane" vertical. All you need is a proper tuner or transmatch to
match the impedance of the backstay to your transmitter. You should be
able to operate on any frequency from 6Mhz through 30MHz.
40M, 30M, 20M, 17M , 15M, 12M and 10M. It is not a sufficient antenna
for lower frequencies unless you provide some capacitance or "top hat"
loading. (d.h. viele quadratmeter auf der spitze).

>It gives in the ship accessory SSB antennae those are approx 4 to 6 m of 1,6
>to 24 MHZ long the entire maritime mobile service field and for the entire
>maritime mobile service field

>Now my question:
>Since these antennae cost approx 600 DM would like to build themselves.

A good tuner will cost less than $140 for power under 300 watts. The
insulation of the backstay from the mast and the hull is mechanical
problem.

You are making it much more difficult than it is. Meters are
typically characterized as "x" milliamps full scale, or as "y" ohms
per volt.

You can be almost home by just taking a VOM and measuring the meter's
resistance with it. If the meter under test goes off scale, then use
the HIGHER ohms range on the ohmmeter to make the measurement. The
VOM itself will have a known current flow through the item under test,
unless it's a VTVM.

For example, say the ohmmeter shows half scale deflection on a meter
that is know to be a 1 ma f.s meter. That tells you there is 1/2 ma
flowing in the item under test. You can tell from how much deflection
you get on that meter how sensitive it is. At the same time the ohms
scale on the VOM has given you the internal impedance of the item
under test. Everything else is just ohms law.

Have you tried a hobby shop? I'm not sure if they'd have what you want,
but they are a good place to go for small bits of hardware in small
quantities. I've bought brass tubing at a hobby shop in the past, and
they had some sort of plastic rods or tubing there if I recall correctly.

> I know of amateurs who have used the "backstay" as an antenna. (d.h.,

Yup, the computer got that wrong, and I'm pretty sure he did in fact mean `backstay'. The backstay is called `Achterstag' in german, and `acht' is german for the number `eight', which is how I suppose the rather linguistically challenged virtual babelfish that did the translation came up with `eightstay'...

[Auf deutsch und in k"urze: Das Achterstag hei"st `backstay' auf englisch]

As an aside, I once took a paragraph from a german newspaper and munged it through the translator that's available on alta vista, translating back and forth between german and english (yes, I was bored). Surprisingly, the iteration actually converged and resulted in something that vaguely resembled modern poetry, but didn't have very much in common with the original passage. Anyway...

Sounds like you need to make a MIDNIGHT RUN. Hammer and a NAIL will fix the situation. Just go and rehang her coax with a new shiny nail right through the center. I have been told that if the coax is loose and not secured properly that your type of problems arise.

Hopefully the next time you make a "midnite run" you are lucky enough to
pick a house where the owner has a double-barrel full of double-odd-buck,
and you catch a load in your ass. Destruction of personal property is NOT
the type of activity we as hams should be promoting. Go back to CB with
your buddy Spew Durigan, we don't need your likes around here.

People, people.....PLEASE.... This group should surely represent the spirit
of amateur radio first and foremost!!
Don't slam ... or tease .... or tear at people who come here for help with
what they are doing for fun.

Please think about sending a helpful or friendly reply (or none at all) and
read it yourself to see if you can figure out what it might sound like to
others who are here in good spirit.
The written word is very different from verbal communication and what is
said with a lift or a smile may seem hurtful on the page.

Anyway sorry to seem so serious .... This group really is a lot of fun.

Thanks , 73's John KD0OM

Hello,

I have these components forsale:

2 LM12CLK, 80 watt high power/performance op-amps, great
IC for audio power
amplifier. $22 each or $40 both. Digikey: $32.20

3 pairs MN3008 & MN3101, the MN3008 is a 2048 point delay device
and
the MN3101 is the clock generator. Applications for
this IC: surround processor, echo
processor etc. $12 each pair or $30 for all.
Digikey sells the MN3008 alone for $18 and the MN3101
for $1.95 (no stock).

2 pairs SPO256A-AL2 and CTS256A-AL2, speech IC and its controller.
$15 for all.

All of the above ICs are UNUSED (NEW), the LM12CLKs are sealed, but I
cannot guarantee them because I have no way of testing them. SOLD AS IS.

Shipping/insurance is $3.50 in CONUS.

If you have any questions, feel free to e-mail me.

thanks for reading

* * * * * * * * * * * * * * * *

BY1QH RESULTS ON 144 MHz EME, SATURDAY, FEBRUARY 7

SUMMARY:

RX and TX performance much better than expected!
Got QRV 45 minutes later than planned. SRI!
Very low local QRM all the time!!! UFB WX.
WKD I2FAK SM2CEW PE1LCH PA2CHR HRD 9H1CD,
Sked 1600-1630 continued until 1728.
PA died at 1900.
We detected only 2-3 unidentified callers.
Seemed like very few called us.....?
Very satisfied any way!

DETAILS:
P=Planned activity
H=This is what happened
UTC
P 1130-1230 EME random.
H 1215-1230 EME random. SRI ABT late QRV!!
P 1230-1300 TEP sked SSB 144.136 MHz with VK6XLR
H 1230-1300 TEP sked. NIL HRD in both directions.
P 1300-1330 EME sked with PE1LCH, PA2CHR tail end. QRG unknown
H 1300-1330 EME sked with PE1LCH. Too weak signals to copy.
P 1330-1600 EME random
H 1330-1600 EME random. WKD I2FAK 1356.
Called 9H1CD 1443-1518, NC.
WKD SM2CEW 1552.
P 1600-1630 EME sked with PE1LCH, PA2CHR tail end. QRG unknown
H 1600-1728 EME sked with PE1LCH, PA2CHR tail end.
The signals were improving all the time, so we kept
on going. At 1700 we just needed the "Q" in our
call sign. Completed with PE1LCH at 1711.
Completed with PA2CHR at 1728.
P 1630-1800 EME random. From 1700 our local QRM is less bad!
H 1730-1900 EME random. From about 1814 there was an
unidentified station calling, possibly sending:

R, N, 52, B, U, and L ...? At about the PA
died....QRT
P 1800-1830 EME sked with PA2CHR. QRG unknown NW.
P 1830-2035 EME random

P 2130-2230 CQ DX 1827 kHz +/- QRM, 400 W & dipole at 30 magl
H 2140-2235 CQ 1827 kHz/1826.6 kHz, QSX 1829. WKD only BV and
YC.

COMMENTS:

VY SRI ABT getting QRV 45 minutes late! Some preparations took
longer than expected.

The local QRM level was so low that we had to make sure several
times that the pre-amp was OK....! UFB! I even switched on the
built in pre-amp in the IC-706. The Chinese new year is VY
important in BY. The university was on holidays, so we guess all
local QRM sources were switched off. Even the paging transmitters
seemed to affect us less than expected, even in daytime.
We were VY happy and encouraged by being able to work "average
size" PE1LCH and hear 9H1CD, after having to struggle with big
guns like KB8RQ, W5UN and VE7BQH.

We got the impression that few stations were QRV since PA2CHR
reported good signals from us during our QSO, also we think I2FAK
called us a 2nd time giving us 529 report, and SM2CEW seemed to
have had a very solid copy of us. He also found our sked QRG
144.120 MHz easily. We even made a few phone calls to SM to try to
stir up some activity, but soon the PA died!! Thanks any way to
SM4SJY who we think made several phone calls for us.

Especially happy about being able to work PE1LCH and PA2CHR who
both contributed with VY important equipment to BY1QH!!! (It is
just too bad that we could not give both of you a "first"!)
Too bad about the new PA going QRT! We really hope we can repair
it. The old PA is still in BY, but it was not in the shack, so we
could not switch.

Next activity is not yet planned, but it is likely to take place
within 3-6 weeks.

Pictures, sound file, log, and other info ABT BY1QH can be found
on: http://www.horizon.nl/~tdekkers/by1qh/index.html
The BY1QH home page is made and hosted by PA3DSS.

Station improvements since 1997 are:
Improved elevation readout at low elevation angles
New RX filter 250 Hz (500 Hz B4), and new PA (presently QRT)

Other equipment same as before:
IC-706 Mk2
SSB electronics pre-amp 0.8 dB NF in mast head

4x9 el Vargarda, total gain 17.7 dB
Stacking loss 0.5 dB, feeder loss 0.7 dB

QTH: LOC ON80DA
Tsinghua University in Beijing

I've played with the MC1350 quite a bit. I've always liked it as an IF amp, although there are probably better/quieter ones out nowadays. The MC1590 is supposed to be a slightly better one.

As you've noticed, the 1350 is very prone to oscillation due to its high gain. You might try leaving a copper guard ring around the input pins; don't know if that'll help but might be worth trying.

I've always used the 1350 dead-bug style on a solid sheet of copper-clad board, myself. That makes it easy to mount a vertical shield (another piece of copper-clad board) across the body of the chip itself, keeping the input and output circuits very well separated electrically.

Sure it is. We talk about SSB and radios often. What we object to is cross-posting, and this thread (now threads) is a good example of why. These "debates" stray from the subject of rbc and end up mixing us up in all kinds of things from other groups. Cross-posting is a violation of the charter. Very simple.

> You should have removed r.b.c from your
> cross post so that any responses (inc this) would have missed your
> newsgroup.

Maybe. I thought about it, but I decided to leave it on so others could pick up on the idea. It usually takes one or two messages for the group to get on top of something... But basically you are right, it should be removed to stop the cross-posting. BTW, my point was not meant to be unfriendly, just to try to keep the situation from escalating.

i've used the 1350's at 10.7mcs with transformer coupling. i used 4700 ohm swamping r's across the primary and secondary windings. the total gain is reduced but my rx is *much* more stable. i used dbl sided pc board, copper traces, and chip bypass caps galore. vertical shields, as suggested, do work. the swamping r's will also provide a stable system.

Don't laugh guys, but how about CB radio? Radio Shack has a ton of
inexpensive radios which could do the job. This is the kind of local
communication CB was supposedly invented for in the first place.

Rob,

I believe the AD7008 (and older device) had a maximum clock speed of
50 MHz ... that would limit you to (a fair bit) less than 25 MHz, to
allow for filtering the output ...

AD has newer parts with up to 125 MHz clock rates ... check their
web side at http://www.analog.com

The mode, believe it or not, is full carrier double sideband AM. Plain old AM. There are lots of ham rigs, scanners, etc that recieve VHF AM air-band signals. Ramsey has a kit receiver, I think, and I am sure it is under a hundred bucks.

The simple way to do this is with an air-band receiver and a DSP or other suitably narrow audio filter. Maybe an Op-Amp based CW filter, for instance. The idea is that a single tone sent (whistle into the mic?) over the air of sufficient duration and strength would close a relay and turn on the lights, right? So you amplify and filter the audio output of the filter. The resulting voltage enables a 555 timer IC that counts say... 5 seconds before enabling a latch for the relay driver. The timer resets in the absence of the voltage. Another timer would be desired to turn OFF the lights after a reasonable time, incase of another signal turning them on.

The RIGHT way is to use a DTMF encoder/decoder setup, This would reduce spurious operation of the lights.

A helicopter is pretty loud. Couldn't you just use a microphone/audio amp input to drive the relay? Again, filtering of the audio could be beneficial. I am envisioning a setup that only responds to the low-frequency tones made by the rotor blade. (The "whop-whop" sound) To get really fancy, how bout a PLL loop that locks onto the rotor beat and triggers the relay driver only when the sound is that of a helicopter? You could turn the gain waaay up this way, and maybe use the local audio method to operate the lights from a mile or so away.

Greetings Christoph !

I sincerely appreciate your learned comments. I am surprised at
myself that I didn't go to the trouble of looking up the word for
"backstay". I certainly would have recognized the problem had I done
so.

Interesting comment on the experiment. I tried that once with a
letter that I had written. I plugged into an english to spanish
translation program and then fed the result back through its spanish
to english counterpart. I was absolutely amazed at how well it did,
The one thing that got screwed up was some reference that I had made
to a golf ball. Otherwise it was almost perfect.

I hope the gentleman with the boat can avoid the DM 600 antenna - I
doubt if was any good anyway - Hi.

If you are referring to the POS-75 device, I have used it in a PLL board which is a copy of the one described by Tibor Bece in his excellent series of articles in Electronics Australia in 1997. The original board was designed to be driven from a PC and have 100 KHz steps over the range 37-75 MHz. In my case I will be using it for the LO of a communications receiver phase locked to a DDS board (which I have yet to build!). The unit tracks a oscillator at 1/10 of the frequency, controlled by a PIC micro to drive the MC145170 PLL. I would think it would work OK but you could get better phase noise performance by just having a VCO cover the range required instead of being able to cover the range of the PO-75. ie phase noise is proportional (among other things) to the VCO sensitivity in MHz/volt.

Disconnect the HV capacitor, and the resonant transformer
will behave like a regular transformer.

You may want to play boost/buck games with the secondary
taps to get a reasonably low voltage before the regulator,
so that the heatsink requirements on the regulator are lessened.

Thanks for the input, guys. Someone emailed that he didnt know the theory, but said these transformers are an attemp to regulate the voltage output. It does make sense that regulation would be a reason for the resonant winding. Years ago, I saw a "ferroresonant transformer" in a surplus catalog. It was from an inverter circuit, so, at the time, I figured it was to shape a square wave inverter waveform into a sine wave, like a tank circuit. I had forgotten all about that till now. My guesswork must have been wrong tho, because this unit is not an inverter, but just a 120 ac powered dc supply. I must have been confusing about the secondary tap. Really, there is 2 separate secondary windings in addition to the resonant winding. These 2 must be identical, and they are wired as a simple center tapped secondary which feeds two diodes to comprise a classical full wave center tapped system. So, my voltage choices are 1) as it is 2) parrallel the windings and use a bridge, or 3) series the windings and use a bridge. For now, I plan on using Jims suggestion and experiment to see what happens when the cap is disconnected. I cant test it greater than about 8 amps, because the only load resistors of sufficient wattage here are a couple of 1500 watt space heaters which give about 10 ohms each (5 Ohms parrallel). Maybe I can round up the toaster and a couple of hair dryers to get to a lower resistance!

I wonder if the high voltage secondary could supply a useful amount of current in the non resonant mode. I also wonder if the current rating could be increased if this winding is not used. I noticed that with no load, the thing draws about .6 amp from the 120 v line and the high voltage windings get medium warm, so I guess theres significant circulating current in the resonant circuit.

regards,
Don

Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.homebrew,rec.radio.amateur.space,uk.radio.amateur

Hello,

I have buy me yesterday the MAF-1700 from Orbit Electronics a MTEOSAT active feed with LNB
the specifications are:

Input 1690 to 1710 Mhz
Output 133 to 153 Mhz
Gain > 60dB
Nf < 0.8dB

I was thinking about myself and wondering if I can use it for tracking low orbiting satellites like NOAA's.
Becourse the converting is like this:

Input freq. output freq.
1691 = 134 Mhz For Meteosat
1694,5 = 137,5 Mhz For Meteosat
1698 = 141 Mhz For Noaa (hrpt)
1707 = 150 Mhz For Noaa (hrpt)

Theoretical it likes to be working for me, what do you think ?

Who can help me out of these problem ?

!!!! ALL INFORMATION IS WELCOME !!!!

Thanks to all you smart people !

With Kind Regards

Geert Pirens

Hope you have the answer you want by now; but if not, a few thoughts: I like the idea of using an ordinary mobile phone BUT...

It would of course be perferctly legal for someone in the air to switch on the mobile 'phone and dial a number when in the air 500 metres away from the landing zone. No extra licence required.

BUT to receive the signal and turn on the lights you would need (1) to know the carrier frequency - easily ascertained - probably in the user's manual, certainly in the installer's instructions;

(2) to know what CODE is sent by the dial button of your choice. Again not hard to find out; international standard I believe - combination of 2 audio tones, although maybe more complicated for recent gear which I've not met (I'm retired!).

Easy to get decoders which in turn operate relays - I'd try Maplin first.

BIG BUT: Anyone else transmitting the same tone will turn on the lights for you. In other words I think the big difficulty would be preventing inadvertent operation by other mobile users.

Next step: You would probably decide that only an unlikely sequence of digits would turn the lights on; now you are into a computer program (not difficult,not expensive) to sit and listen; and turn on the lights only when a mobile 'phone sends the right sequence of digits. ALAS, Murphy's Law says that someone will use it sooner or later; the reverse of the Lottery Number effect if you like although a similar number of chances.

MY ALTERNATIVE APPROACH: Have a look in the Maplin cat (or similar, or I'd look further for you). There are many surprisingly cheap short-range digital remote control devices which are licence-exempt because of extremely low power (like key fobs) and very high accuracy of calibration.

Expect you are fixed up by now but the offer's there.

Hi Lou OM,
If you have 6.3 V transformers at adequate power, why don't you just remove some turns from the secondary to get your 5.0 V? Or, wind some on to cancel out some of the turns, to get 5.0V either way. Many 60 Hz transformers are approx 1 volt per turn. You can also wind a few turns on to either boost or buck the PRIMARY, to get dialed in on the secondary voltage you need. You can also put a transformer in series with the input AC, and buck or boost that voltage. I have used these technique to change the output voltages of various transformers. My approach is to avoid actually BUYING anything at all costs! With that as the primary motivation, it is amazing what you can come up as a solution. What are YOUR priorities?

REPEATER MODIFICATIONS FOR POPULAR MOBILE RADIOS!

Information Sources has compiled an impressive collection of well written instructions for converting many popular commercial mobile radios into full repeaters. Some of the files, such as the MASTER2.TXT file (included below) which describes how to wire a Mastr II mobile radio for use without a control head, are original works and are copyrighted by Information Sources. The information may not be reproduced or republished via Internet, CD-ROM, or any other media without the express written consent of Information Sources.

The repeater modifications are available for sale on 3.5" HD floppy disk, IBM PC format only. All information files are ASCII text. The following files are currently offered on the Information Sources Repeater Modifications disk:

MICORDUP.MOD Converting UHF MICOR mobile radio into a repeater
MICORUHF.MOD Converting UHF MICOR mobile radio into a repeater
MICORVHF.MOD Converting VHF MICOR mobile radio into a repeater
GE_EXEC2.MOD Converting GE Exec II radio for repeater & 9600 pkt
GE_MVP.MOD Converting GE Custom MVP radio into a repeater
GE_PACKET.TXT 9600 and 1200 Baud packet on GE EXEC II and MVP
GE_MVP.TXT Basic MVP information and 1200 baud packet use
GE_MVPEX.MOD Another 9600 mod for GE_MVP (Complicated!)
MAXTRAC.MOD Converting the MAXTRAC for operaion on 900 ham band
MITREK.MOD Converting MITREK mobile for 9600 duplex packet
MITREK2.MOD Converting MITREK mobile radio into a repeater
MITREK.9K6 Converting MITREK mobile radio for 9600 packet
MASTRPRO.MOD Using GE Master Pro receiver strips for repeaters
MASTER2.TXT Wiring the Master II for use without Control Head
MASTER2.MOD Converting GE MASTER 2 mobile radio into a repeater
MOTOSPKR.TXT Adapting and wiring Motorola Amplified Speakers
WILSON.TXT Programming Wilson/Regency synthesized mobile rigs
BR.COM A simple DOS file viewing program for handy use
BABYRPTR.TXT Convert a Fisher-Price baby monitor into a repeater
LIST.COM Another easy to use file viewing utility program
PKUNZIP.EXE Dearchiving utility program to use with *.ZIP files
PD-203.ZIP Shareware program for POCSAG (pagers) monitoring
PE-205.ZIP Shareware program for POCSAG encoding(transmitting)
\DECODE*.* PD-203.ZIP file de-archived - POCSAG decoding
\ENCODE*.* PE-205.ZIP file de-archived - POCSAG encoding

The following is a reproduction of the MASTER2.TXT file which is included on the Repeater Modifications disk described below offered by Information Sources. The MASTER2.TXT file describes how to wire the GE Mastr II mobile radio for operation without the control head and control cable.

Wiring the GE Mastr II without Control Head

I'm sure many of you out there already use Mastr IIs without control heads but there are probably many who are not too familiar with this radio. There was a recent article about using the Mastr II mobile as an emergency intermittent duty repeater by Terry W. Ellis in the September 1993 issue of Mobile Radio Technology Magazine. The article did not elaborate on wiring the Mastr II without a control head. It can be done. I will not go into the modifications needed for repeater operation. Rather, I will just explain how to wire the Mastr II radio for operation on a single frequency without the control head.

1. Ground (called A- by GE) comes out to pin 30 or pin 21 on J901 the Main control plug on the front panel of the radio.

2. 13.5 volt DC must be connected to pin 29 (called A+ by GE) and pin 24 (Ignition Switch) of J901.

3. The Tx PA supply is separately wired to the big red and black wires at pin 39 (TX+) and pin 40 (TX-) of J901.

(NOTE: Be sure to use fuses for both the PA and the low current Rx and Tx exciter even when testing and wiring on your bench. I was lucky and only smoked a few small traces on the Mastr II front panel board which I was able to bridge with new wire. The damage could have been much worse. Reverse polarity diode protection (like the PA has) would also be a good safety practice for the rest of the radio unless you like the smell of burning radio parts!) (I'd suggest 15 or 20 amp (for lower power testing) on the PA and 2 or 3 amp maximum (for testing) on the Rx and Tx exciter.)

4. The volume and squelch controls can be made with internally mounted 10k trimpots. High side on both vol and sq connect to pin 11 of J904 RX/IF/AUDIO/SQ board. (GE conveniently labels all the pins connecting the major sub-assemblies to the front panel and system board of the Mastr II.) Low side vol and sq connect to pin 12 of J904. Sq center control arm is connected to pin 10 of pin J904. Volume center control arm is connected to pin 13 of J904.

5. The frequency or channel is selected by taking the F# pin to ground. Grounding either the Tx or the Rx F# pin also grounds the corresponding F# channel on the other Tx or Rx. (I guess you could rig the radio for multi-channel use by making a multi-select switch for each channel to ground.)

6. Audio (Speaker) output is taken from J904 pin 19. Pin 18 of J904 (labeled Speaker Low) is connected to ground. Connect an appropriate loading resistor (8 to 20 ohm 1 or 2 watt minimum) to prevent audio amp oscillation if you do not have a monitor speaker connected as with packet, etc. Speaker audio could also be taken from the red test jack as explained in the next step.

7. PTT and mike connections can be taken from the red test set jack, J905. Here is the pinout:

Pin 1: Speaker high (Audio out) Pin 6: A- (Ground)
Pin 2: Speaker low (ground) Pin 7: Microphone high
Pin 3: Regulated 10 volt Pin 8: Microphone low
Pin 4: A+ (13.5v) Pin 9: A- (Ground)
Pin 5: PTT Pin

Note: The radio keys by taking pin 8 on U901 (10 volt regulator) to ground. If you operate the Mastr II WITHOUT the CHANNEL GUARD strip installed you will need to jumper pins 6 and 8 on J908, the Channel Guard plug in card. If you try to key the radio at the meter jack without the Channel Guard board installed you won't get anything except frustration. I was dumb-fuzzled for almost a week before I noticed this one little bridge on the schematic diagram of the front panel board. Lesson: If you intend to use Channel Guard keep the card installed when you test the radio. If you do not use Channel guard, jumper these two pins so the PTT will work properly from the red metering jack, J905.

To kill Channel Guard (e.g. for tuning or testing the receiver) take either Pin 6 of J901 (front panel plug) or Pin 3 of P908 (Channel Guard plug) to ground.

Having a schematic diagram for the Front Panel & System board for the Mastr II is certainly a great aid. It is very difficult to trace out the connections without a schematic since the board has circuit traces on both sides and uses a number of holes to pass circuits on both sides of the board.

I have found an easy place to drill holes for wiring access is on the black plastic front panel main wiring connector. There is an area on outer side of the two big pins to the Tx PA which can be drilled out to pass control wires. I tried to solder directly to the pins on the main connector without much success. I like the internal wiring better. (Note: Molex pins slide very nicely over the pins on the Mastr II front plug. Use heat shrink over the connectors to avoid shorts and add a neat appearance. Also, you can solder directly to the large pins for TX PA by scrapping off the plating and soldering directly to the bare brass pin.)

All the information on the disk is believed to be accurate, however some errors may inadvertently appear and the user assumes full responsibility for the use and application of all the information contained on this disk. No warranties of any sort are expressed or implied. Referral to the appropriate service manuals for the various radios discussed is certainly recommended in every case. The information on the disk presumes the user already has familiarity with the radios discussed, and hopefully, a copy of the service manuals for the radios.

In case service manuals for the radios of interest are not available to the user this distributor has prepared concise written and illustrated operating guides for the General Electric Executive II radios, Master II radios, and Custom MVP radios. Each guide runs about 20 to 25 pages in length and contains necessary schematic diagrams, exploded parts diagrams, tune-up instructions for VHF and UHF radios, and repeater modification instructions with diagrams, as needed. The guides are available for $15.00 postage paid when purchased separately, or for $12.50 when purchased with the repeater modifications disk. (See special pricing offers following the order form, below.) Much of the information on the disk is included in the GE operating guides, but the guides additionally include tune-up instructions, schematic diagrams, and additional helpful hints which are not included on the disk.

The Repeater Modifications disk is available by mail by using the order form below:

The origional enquiry was a marine band radio enquiry, is that not
allowed in rec.boats.cruising? You should have removed r.b.c from your
cross post so that any responses (inc this) would have missed your
newsgroup.

>Can anyone tell me the basic theory behind resonant power transformers?
>...This winding appears to operate at
>about 700 volts. Thanks for any theory or suggestions.

If you were to try an parallel resonate the primary of the filter
inductor at 120 Hz, the capacitance required and circulating current
would be very, very high because the inductance is so low. But by
using a secondary winding, you trade voltage for current and
capacitance. The primary appears to be resonant because the secondary
is so closely coupled.

The idea behind this resonance at 120 Hz is to limit voltage sag;
here's how. When the current is low, the parallel-resonant inductor
allows less peak charging current to get to the capacitors because
it's a high-impedance at the ripple frequency: 120 Hz. When you start
to draw current from the supply, the inductance changes, the resonant
frequency changes, and the ripple is allowed to get to the capacitors
without the high-impedance being in its path. (Back in the bad-old
days, you could actually make the plate voltage on an AM rig increase
as you modulated it.)

In SSB amps, the tuned reactor is not such a great idea. The Collins
30S-1 used this scheme and it always modified the CW note so much that
I always used the 30L-1 or my Alpha instead. Both had capacitor input
power supplies that had horrible voltage stability when compared to
the 30S-1--at least on the meter. But using a scope you could see the
30S-1 goof up the CW waveform much more than the other amps.

You bet!
I've done this with the Reveal RA300, the Surplus Direct cards and one that Best Buy is now selling for about $30.00 (AI Tech or something like that.. Each of them has the same Synthesizer/Receiver chip pair. The retuning of the VCO consists of replacing the oscillator coil. The Surplus Direct card can be retuned by simply spreading the turns of the coil apart. Ive gotten the Surplus Direct card to receive from 65.75 MHz to 162.55 MHz (with appropriate coil changes, of course).

Both of these cards use the Philips TEA5712T AM/FM receiver chip. The synthesizer is one of two nearly identical Sanyo chips,
the LM7000 or LM7001. The data sheet claims that they are software compatible. This means minimal software changes between the cards. All data sheets are available on the web in Acrobat (.PDF) format. Both Synthesizer and Receiver chips have both AM and FM sections, with the AM section unused because the QRM that computers continuously pump out.

I created a jig to run the cards out of the computer so that I could work on them on the bench. This consisted of an 8-bit slot robbed from an old motherboard with the address bus tied to the required address. I connected this to the parallel port of the computer, with the data bits connected to the data bus, and the STROBE line from the parallel port connected to the IOWR pin on the slot. It works beautifully, even with a 25 foot ribbon cable. These little cards have tons of possibility! Right now I'm trying to build them into a car stereo that will get more than just the AM and FM broadcast bands. Anyone wanting more details, please let me know.

Message-ID: <34E23759.516F@taxes.net>
Source record: 86526

The high-voltage tap will supply some power in the non-resonant mode, but generally, it's not enough to be really useful, either current or voltage.

You might get lucky and be able to use it as a screen supply for a big amp, or as a plate / generic HV for a tube receiver. Last one of these I messed with gave about 350 volts at about 80 mA.

With as much iron as it's wrapped around, you can be sure the power limitation is the resistance od the winding, and not core saturation.

1500. MC1350 video amp IC's

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-11 00:00:00 UTC
From: Rich Griffiths <richg@one.net>
Message-ID: <34E23848.E0D71B17@one.net>
Source record: 86527

I recently built two IF stages using 1350's. One works at 50kHz, the other at 1650kHz.

The two circuits (both built on home-made etched PC boards) are almost identical. But I'm having trouble with the 1650 kHz one. It seems to oscillate when I run the AGC voltage below 4.9 V. I think I've got all the right spots bypassed properly for 1650 kHz, and I don't have the right equipment to check all the other possible ways this thing might oscillate.

Has anyone got experience with these IC's? They used to be popular. I'd appreciate suggestions on how to tame this thing.

I don't know where you're located, but there is a plastics company in California called TAP PLASTICS that has anything in plastic you can think of. Their within California phone is 510-351-0422; outside of the state is 1-800-821-1984. They have rod stock from 1/16 to 3" in acrylic; fiberglass from 1/8 to 1". Call and ask them for a catalog.

I have used this chip but at much higher freqs. Did not experience problem, so cannot comment directly... You might check the layout for ground loops/feedback. Also, if not already tried, use low ESR caps, bypass supply well, etc. - try tantalum... Good luck! Woody

Dear Dan,
I suggest using a weak transmitter and a CB with an "S" meter for the receiver.
A weak transmitter can be constructed by using a CB crystal in a colpitts
oscillator. A 2N3904 or 2N2222 will work fine.
Try this circuit:

This circuit will oscillate at 9MHz (make sure you use the Transmit crystal!)
Please let me know if the ASCII graphic makes it out of AOL. The CB will pick
up the weak 3rd harmonic. Put in a shielded box or a tin can if the signal is
still too strong.
Hope this helps,

If the meter is in good shape you might find that it is worth quite a
lot to a Heathkit collector who needs a new meter for his DX-60. I
don't know specifically whether this is true for this meter, but it
might be worth checking.

1512. Anyone ever modify a Knwd TK-820 for ham band use?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-12 00:00:00 UTC
From: jimn0oct@aol.com
Message-ID: <19980212045500.XAA28137@ladder02.news.aol.com>
Source record: 86342

I recently acquired a Kenwood TK-820 commercial UHF rig at an auction [the price was right]. I have a local source that has programmed the rig, but the rig won't transmit *or* receive below 445.5 MHz. We've tweaked the output filter so it has a better response at 446 MHz, but the total lack of receive signal and the garbage that is present on transmit below that is frustrating. No matter where you program the rig below 446 MHz, the transmit frequency is about 445.556 or so.

Anybody ever work on one of these? Got any good ideas?

Thanks

73,
jim n0oct

Depends on distance, of course, but most are five minutes or less. Even the
smallest little bulbs will do that!! I mean 3/4 inch!! A bigger tube will
do more chips at a time. Get the lamp close to the chip windows. Within 1/4
to 1/2 inch or 1cm.

I second the idea of making an oscillator with a 9 MHz crystal. Or you could use an integrated circuit - one of the many which contain 4 similar gates. Connect 2 of the gates round in a circle (out to in, out to in) and wire the crystal across in-to-out of ONE of the gates. (Ground the inputs of the 2 spare gates to prevent them getting up to anything.)

To the previous suggestions I would add "use a resonant aerial for more repeatable results". But as the ideal aerial length is a half wavelength, ie 5 metres, that is impractical indoors. So just settle for a FIXED length of aerial; why not 10 cm?

Have the rest of the transmitter in a screened box so there is only one path out. Have the receiver in a screened box for the same reason.

Next problem: Indoors, radio signals bounce off things, and refract around edges, in unpredictable ways. (Not really unpredictable; but the maths is very elaborate and would take a giant computer many hours.) So you can't eliminate these "multiple paths" but you can make them constant by not moving anything in the room which could reflect the signal; nor any object between T and R, with edges round which the signal can refract.

That would be easy - just don't move anything - but at CB wavelength, the human body both reflects and refracts. It also absorbs! All you can do is make these unknowns constant by standing still in the same place for every measurement.

Get the hang of how objects in the room affect the results, by watching the S-meter whilst you (or someone else) walks slowly around, moves furniture, opens doors etc.

When you have made all the unknowns "constant", you can then compare the shielding effect of different materials (in the form of different obstacles) placed between T and R. Try to put every obstacle at the same place. Try to have only ONE thing change between readings (very difficult! You would never get 2 blocks, different materials, exactly the same size and shape for example.)

Good luck! Become a scientist; leave the guessers to explore blind alleys and learn nothing!

The Benny Hill show in the US was the variety like UK version editted to
a "Laugh In" pace. The two show versions were quite different. FOr
those in the UK, it turned Benny Hill into Kenny Everett.

>Don

Ferroresonant transformers have two magnetic circuits. One for the
primary, and another for the secondary. They are separated by a flux
gap. The resonant winding bridges the flux gap. With the resonant
winding not working, there is little flux coupling between primary and
secondary, and you get little output voltage, and even less output current.
When the resonant winding is working, the primary pumps it to a very high
resonant pk-pk voltage which is limited by gap saturation. The secondary
then couples energy out of this fixed voltage tank. So you get a nicely
regulated secondary AC voltage with no spikes. If the voltage on the
primary sags or soars, it doesn't matter (at least over a range of about
85-130 VAC), the secondary voltage will remain constant thanks to the
resonant tank.

I know this isn't quite the right group, but I was wondering if there was anyone from this
area who could suggest companies in the UK (for which I have a work VISA), who might offer short
to medium term contractual employment in this field.

I have four years experience from a defence background, and will be looking for work in UK from April
1998 (after a month in USA) . Im also interested in working in USA, but at 26 yrs old, have just
missed out work-VISA elegibility (could this be overcome?)

Good luck with what ever problem you happen to be working on, and thanks for any advice you may
offer.

Thanks Gary,
This is beginning to make more and more sense. Last nite, I unhooked the resonant winding, and made a simple test. With a fixed load (no filter cap), the output dropped from 39.1 volts at 7.4 amps to 25.4 volts at 4.5 amps. (The current measurement is crude, since I just looked at the built in meter, which is coarse and not real accurate.) I measured the line current and wasnt real pleased with the efficiency, so I thought it best to retain the resonant winding.
I did notice a wierd piece of core near the primary winding, but havent looked too closely, so I dont know if it is separate from main core or what. I suspect, upon further exam, this will be an implementation of the flux gap.

Obviously, this unit will not work well with a variac to provide an adjustable output, which was one of the ideas i had contemplated. Right off the top of my head, I am wondering if there is a way to change the resonant circuit to effect a change in output voltage, with or without an accompanying change in input voltage. My intuition tells me not, but I will think more of it. I did notice something about the capacitor. Last nite, I couldnt see the value of the cap, so I removed it to look. It is a 4 mf at 600 v. But I noticed a handwritten 3.9. Seems it must be critical enough for the mfgr. to check each cap for some level of accuracy. Also noticed that the cap is operating above its rated voltage, but I cant remember what load conditions were when I measured the 704 volts across it a couple of days ago.

Anyway, thanks for the input! I only knew these things existed till now. Strangely enough, I couldnt find any mention of them in any of the arrl handbooks I have on hand and quite a few electronic textbooks, ranging from terman and radiotron all the way up to the late 70's.

Regards,
Don

My favorite (but not recommended) solution for this went this way:

A friend had a neighbor who's CB was the bane of the neighborhood. Overpowered,
overmodulted, interfering, etc. The neighborhood became frustrated in its efforts
to have the man stop the problems caused by his CB.

Finally, in frustration, a ham in the neighborhood waited until the next time
the CBer was on the air, turned his yagi toward the CBer's house, tuned his
HF rig to the CBer's freq, fired up his 10-meter linear amp, switched to CW and
put a book on the key for a good 30 seconds.

A few minutes later there was a knock on the door. It seems that the CBer's rig
had somehow started smoking and quit and could he please take a look at it and
see if he might be able to fix it.

Said sorry, but no, and closed the door.

The neighborhood was never bothered by a CB again.

****

I've used them a lot and never had problems but I was careful not
to use too high of a load impedance. I prefer to use them single
ended and use a collector load of about 1 K. Also, I bypassed the
unused collector directly at the pin , as well as the unused side
of the differential input. Finally, put a cap to ground right at
the AGC pin -- something that will keep the low freq off of it.
A sneak path could be from the output around to your AGC input,
which is of a VERY high sensitivity at the pin.

The MC1350 really has a current controlled AGC with an offset voltage
of a fixed percentage of the B+, which in your case is a bit over
4 volts. Voltage lower than this can force no current into the pin
and cause no gain reduction. But , right at the threshold, where
the gain is highest and AGC has just started, it is VERY sensitive to
voltage at the pin. So a bypass there will help to remove any
signal .

Good luck. Bye the way, the MC1590 is exactly the same chip, but
comes in a metal can and costs a bunch more. You can use the
data sheets for the two interchangeable for most parameters.

>>
>> Roy Lewallen, W7EL

,
"The Simplest Phased Array Feed System . . . That Works", which begins on
p. 25.

A formula for the current out of a lossless transmission line relative to
the voltage at the input of the line is:

Iout/Vin = 1 / (Zload * cos(theta) + j * Z0 * sin(theta))

where

Iout = the current at the output of the line
Vin = the voltage at the input of the line
Zload = the load impedance seen by the line at the output end
theta = the electrical length of the line
Z0 = the line's characteristic impedance

Zload is a complex (R + jX) value; Z0 can also be complex but is generally
very close to being purely real (resistive) at HF and above.

You can find this equation in a lot of places. One of my favorites is
Reference Data For Radio Engineers.

If you connect two lines from a common point to two different loads, the
voltage is the same at the inputs of both lines. So the ratio of the
currents at the outputs of the two lines is:

```
Iout2/Iout1 = (Iout2/Vin) / (Iout1/Vin)

= (Zload1 * cos(theta1) + j * Z01 * sin(theta1))
/ (Zload2 * cos(theta2) + j * Z02 * sin(theta2))
```

where the notation is the same as before, but the '1' and '2' refer to the two different lines.

Just a little bit of playing with this equation will show you that the ratio of currents isn't equal to the difference in electrical lengths of the lines except in some special cases (one of which is when Zload1, Zload2, Z01, and Z02 are all equal).

Now, let's take a look at the EZNEC example. One consists of two identical vertical elements fed with currents which are equal in magnitude and 90 degrees out of phase, with element 2 lagging. That is, Iout2/Iout1 = 1 at an angle of -90 degrees. Although each element by itself has a feedpoint impedance of 36.7 + j1.2 ohms (nearly resonant), mutual coupling changes the impedance of element 1 to 21.0 - j18.7 and element 2 to 51.6 + j20.9. (To learn more about how and why this happens, see Chapter 8 of _The ARRL Antenna Book_. It'll also show you how to calculate the impedances if you don't want to use an antenna program to do it.) Now, these are the feedpoint impedances we would see IF THE ANTENNA WERE SOMEHOW FED TO ACCOMPLISH THE DESIRED PHASING. But it doesn't tell us how to do it. If we hook say, a 90 degree 50 ohm line to one element and a 180 degree 50 ohm line to the other and feed from a common point, we end up with a current ratio of 1.1 at an angle of -121 degrees. (I used EZNEC to get these values, but you can calculate them using Eq 7 in the Compendium article instead.) If we use 180 and 270 degree lines we get 0.53 at an angle of -105 degrees. These both reduce the front/back to around 10 dB from the 25 or so we get with proper phasing. In both these cases,
the impedances of the elements won't be the values I stated earlier, because the currents aren't as planned. This in turn affects the transformation of current and voltage in the transmission lines.

The trick is to find a pair of line lengths which will give the desired current ratio WHEN PRESENTED WITH THE ACTUAL IMPEDANCES OF THE ELEMENTS. If we connect an 80.56 electrical degree, 50 ohm feedline to element 1 and a 154.53 degree, 50 ohm feedline to element 2, the ratio of output current to input voltage of the first line is .001603 - j.02150 and the second is -021.39 - j.001225. The ratio of these is 1 at an angle of -90 degrees. (These were calculated using the equations I gave above.) The difference between the line lengths is 74 degrees, not 90. A similar antenna, fed with 75 ohm lines, is used as an example in the Compendium article (Table 2, p. 26). Two different sets of lengths give the desired current ratio of 1 at an angle of -90 degrees. The lines in one set differ in length by 86 degrees; the ones in the other set by 52. The Compendium article includes a program to calculate these values for you.

The results from the equations, from EZNEC (or any other NEC-2 based
program), and from current magnitude and phase measurements I've made with

```
%
```

this, the article, and the Antenna Book chapter over.

You could buy (from most small hardware shops) a "fluorescent torch" with an 8 watt (visible) tube in it; take out the tube and replace it with the UV one - same fitting. Whole thing costs less than the parts. Or copy the circuit from one. You need one transistor (medium power npn), a small transformer (ideally made for the purpose but a very small mains to 6 + 6 V works fine), and up to 3 resistors and 2 capacitors. It's nothing more than a Colpitts (or any other) oscillator running from 12 V, with at least 180 V appearing in the mains winding as a result. They really are bog minimum standard, nevertheless they seem to last for ever.

If no luck at hardware shops, try Maplin (a branch near you) or Circkit (mail order).

<More snip>

Ho hum, yawn, another "blew the front end right outta their radio"
story.
Darn, used to hate having to rebuild the front end of my mobile CB rig
every time I went to the Dayton Hamfest. That pesky VOA transmitter site
north of Cincy, you know. Had to be careful to turn the car radio off
too, else WLW (50K watt 700 AM) would get me.

Course, too, there was the CBer down the street who used to trip the
local utility's OCBs when he "keyed-down" with his big amp. Heard they
told him not to run the amp until after midnight so he wouldn't cause an
overload on their system.

Yeah, right, and a hundred other tall tales....

C'mon guys, didn't any of that theory you learned (memorized?) to get
your license stick with you?

Hello you all.

I am building me a receiver till I saw that I can get the COILS nowhere !!

Does anyboby can tell me where to buy these coils or HOW TO MAKE THESE COILS
AT MY SELF ?

These are the coils I need:

L1 - 4.75T 0.7mm ECW TAP 1.25T
L2 - 4.75T 0.7mm ECW CT
L3 - 4.75T 0.7mm ECW CT
L4 - 4.75T 0.7mm ECW
L5 - 10.75T 0.4mm ECW
L6 - 4.5T 0.7mm ECW CT
L7 - 4.75T 0.7mm ECW TAP 1.25T
CH1 - 3T 0.4mm Ferrite Bead.
CH2 - 3T 0.4mm Ferrite Bead.
T1 - 20T pri. / 5T sec.

All coils 5mm NEOSID F29 Slug.
0.7mm Coils spaced 1 wire dia.

I dont understand the above so who can tell me more about the above
information ?
I was wondering whats the meaning about this ECW, SLUG, TAP, etc..
Who can fill in these questions ?

ECW TAP ?
ECW CT ?
ECW ?
Ferrite Bead ?
NEOSID ?
F29 Slug ?

I thank the peopele who response me !

With Kind Regards.

ECW - Enamel Coated Wire
TAP - A tap on the coil 1,25 turns from one end.
Ferrite Bead - A premade cylinder of powdered iron with a hole through it.
NEOSID - got me.
CT - Center Tap
Slug - A preformed powdered iron material with threads that screws into the
coil to adjust its inductance

As others have said, in the US pilots can activate the lights by clicking the mic 5 times rapidly on the "unicom" frequency.

Have your brother ask around at avionics shops for an old radio, perhaps one with a dead transmitter. A unit that is no longer "airworthy" can be gotten very cheaply, many times for free. Try to get the wiring harness and a copy of the wiring diagram.

The transmissions are AM, but that is irrevelant in this application. You will
need a 12 or 24 volt DC power supply, several amps at least if you are using a tube (valve) receiver. Set the squelch reasonably high but not all the way
tight. Pick an unused frequency for your area, unless you are in a congested
area this is easy... but be extra careful to verify from charts that the freq is
not used for a 40 mile radius. That should give a decent margin of safety.
Make a circuit to close a relay (a solid state triac "brick," or SSR, would be
the easiest to drive) after 5 or whatever squelch openings within 10 seconds.
Do this with a decade counter which has a 2 second timer (which is reset by any squelch transition) connected to the reset pin. Make the "5" output also disable the clock input so more than 5 pulses keeps the unit on also. Once the output goes true, switch the reset timer to a 5 or 10 minute time out period so the lights reset after this time.

With this setup there are no changes to the aircraft, no extra equipment to carry, and standardized procedures are used.

Now Walt... you know that's not true... Americans are quite comfortable having sex... so long has each partner has a recent blood test, notarized complete sexual history, industrial grade condoms, the lights are out, blindfolds are worn, and it's between the hours of 11:30pm and 11:45pm... there... see we're not uptight at all!

Dear Geert,

I vaguely remember Neosid was the name of a coil manufacturer.
Could be wrong.

But to design single-layer coils given the number of turns, wire gauge, diameter of former, winding length, or the other way about by experimentation, for a required inductance, or to resonate with a given capacitance, or, or, or, etc. Download "SOLENOID.exe" program from my website in 10 seconds. Not zipped up. Free takeaway. No catch. Can be used immediately.

Will cater for antenna loading coils, big trans-match coils, and tiny little things at 145 MHz.

Generally speaking, having designed a coil using the program, its inductance can be increased by, crudely, up to 40 percent by inserting a small iron dust or ferrite slug. But you will need internally threaded coil formers.

Regards, Reg.

i hope you find a good answer to this. I put caps and filters right
at the pump (you have two pumps one in tank, and one on frame) and
tried all kinds of things. noise went from S9 to S7 on 15m and 10m
bands. not much of an improvement i must say!

Source record: 86296

The ARRL microwave experimenters handbook volume 2 has an article on this.
A radar detector uses a gunneplexer operating at about 11.5 ghz (convenient for
both x and k bands) so all that is needed is to retune to a lower freq. The
horn tuning screws might need to be completely removed to go this low. Then
just modulate the gunn supply voltage using a simple audio circuit.

hi
I am making 100kW, vhf amplifier and has some question .
When the filament is power on, its voltage and current is 0.3V/30A
and power is off, the resistance of it is 2 ohm.(filament is warmed
condition)
Then how do the voltage and current of the filament become 0.3V/30A at 2
ohm??

And when it is cooled down to room temperature, its resistance is 0.5
ohm.

I am looking forward to your reply.

REPEAT POSTING

*** Mailing List *** UK-Vintage-Radio

The mailing list UK-Vintage-Radio is designed to promote the
interchange of information between collectors of (mainly) British
broadcast and communications radio sets.
It is meant to complement, rather than compete, with other
lists/Newsgroups of a similar nature.

Topics for discussion:-

* Collecting, refurbishing, storing.
* Sources of materials and components.
* Technical queries and discussions.
* Wanted & For-Sale.
* News of forthcoming events.
* Service information.
* Books and Publications.
* Societies, Museums info.
* W.H.Y.

TO SUBSCRIBE to the mailing list,

Email: uk-vintage-radio-request@webaware.co.uk

include 'subscribe' in the main body of text.

It is hoped that this facility will be of use to those who collect and
refurbish old radio sets, be they broadcast, ham, or military.

The list will be as strong as its contributors, so please feel free to
subscribe. It is hoped that it will provide a vehicle for sourcing
service information, manuals, and spares, also a good place for
technical discussion, hints and tips, buying and selling, etc.
Best of all, it's FREE!

Since I read most of the posts, and found that nobody was giving information you would find helpful, and since I have no idea personally where to look, I would suggest a library. They often have many volumes available for all sorts of ham equipment, and electronic equipment in general.

Good luck.

Hello--
A filament's resistance is (or should be) lowest when the filament is
cold; as the filament heats, its resistance increases.

At very low resistances, you need to make four-terminal measurements--
merely attaching a two-wire ohmmeter won't give you a meaningful value
of resistance.

Good Morning, Andre,

If I correctly understand the prefix "back" in a nautical context, it
would mean "forecastle" or "foc'sle" as we say. If that's the case
then wouldn't the german word Backstag translate to Forestay?
Continuing with that thought, then it's no wonder that languages can
become so confusing. Anyway, makes a nice conversation item.

What you are talking about is obviously illegal.

Since you don't seem to care too much about the law maybe you could get your
hands on a CB radio and get it "peaked and tweeked", remove the modulation
limiting circuitry, hang a power mic on the thing, and have your fun...

How would you like to get MILES of range?

How would you like to communicate with more people with your interest?

How would you like it if it were legal?

Consider earning the new Technician class amateur radio operator license. Hams have been running regular (fast-scan) TV for years. Some hams have been putting TV transmitters in high altitude balloons and radio controlled aircraft too. If you can pass a short multiple choice written test you can become a ham! There are several study guides available to help you learn OR if you simply want to pass the test the question pool is PUBLIC!

1579. MC1350 video amp IC's

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-13 00:00:00 UTC
From: pacyna@worldnet.ATt.NET
Message-ID: <003101bd3897$75cc91c0$da66440c@ed>
Source record: 86311

If you look at the Motorola application note for the 1590/1350, it discusses stability.

Basically the stability for maximum gain is a function of the Input and output impedance product at a specific frequency. In other words, Rs X Rl = K. At 10Mz, K is about 3,500,000 (for maximum stable gain of around 55dB).

Note: The device input impedance is around 3,000 ohms (so consider the parallel equivalent when using a input loading resistor). The output impedance is very high and is basically set by whatever load it is connected to (don't forget to consider any transformer action, whether you use single ended or differential out etc.).

Don't see how the voltage, current, and resistance agree - even allowing for hot resistance to be 8 to 10 times cold resistance.

I don't see how such a small heater could serve a 100 kW amplifier.

I wonder what you are going to do with the output power.

I wonder what you are going to run it FROM.

In short, I think there must be mistakes in some of the figures I'm reading.

Hmm. From an illustration in a german-language book, I derive that the
`Achterstag' is a single stay that runs down from the top of the mast to
the stern along the centerline of the boat. `Backstagen', of which there
are two, run down sideways, aft of the shrouds, but still forward enough to
be in the way of the boom. Therefore they are kept slack on the leeward
side and need to be adjusted each time you change tack. I guess they're
not very common any more (probably because modern rigs leave room for a
fixed backstay).

As I said, this is just what I'm gleaning from a little figure and may
not be accurate in general. Also, I don't recall the english term for
`Backstag' (`running backstay', perhaps?)

Purchase a good cb. Transceiver and a pair of Moon Raker's, put the Moon Raker's on top of a 100' tower, catch your neighbor's Tomcat tie his feet tightly together so he can't get away, then tape his tail to the mike make sure that the mike is key down, at the same time this will give you a loud beacon with a variable tone.

Source record: 86327

Hi,

I'm looking for an electronics engineer/enthusiast who is interested in designing a small electronic instrument. You should have experiance of frequency measurement techniques at RF frequencies (<10 MHz) to 0.1 Hz resolution and the ability to write software and design the corresponding hardware to multiply the measured frequency by a user entered factor. Analog and RS232 interface experiance could also be advantageous.

Please contact me for further details and suggestions.

>------------------------------
>vissit my multi interests homepage at:
>-> http://user.glo.be/~pass <-

I've built my own Noaa hrpt receiver, and tracking noaa hrpt signals in
the way you suggest was my starting point.

Feed the output of your downconverter into any vhf radio / scanner
capable of receiving ssb, and wait for a pass. Watch out for the doppler
of +/- 50 khz on an overhead pass. Your Meteosat feed should pick up a
strong signal from any of the noaa's.

If you know when a pass is due, fine, but if you don't, perhaps the
easiest way is to tune the vhf rx to 137.62 Mhz narrow FM and listen out
from local noon onwards. A 2M dipole works fine. Sometime within 1h 40m

you'll hear the distinctive clip-clop of the APT signal from the satellite. Quickly plug in your downconverter, tune the rx to 150 Mhz and listen around on ssb for the hrpt carrier. Use 100 hz steps if you can, and you'll soon find it. The pass lasts about 10 minutes and has severe doppler, so don't hang about!

If you're interested in wxsats, I suggest you join the Remote Imaging Group. They have a Web page at http://www.rig.org.uk

BTW don't expect anything more from the hrpt carrier than a whistle. To receive pictures you need a steerable (az-el) 1m dish with ideally a circular polarised feed, a phase discriminator receiver with about 5 Mhz bandwidth, and the software / hardware for your pc. Great fun to get going, and some stunning pictures.

Actually, the worst part of the ship to be berthed in is near the Chiefs
mess after "Chili" night... ;)

The back part of the ship is generally referred to as "aft" or "stern"...
old sailing ships used to have a "quarterdeck" which was generally an
elevated deck in the aft of the ship often where officers were berthed.

Please help me to identify plastic SO SMD with the following package markings:

Marking No. of Pins

T1 6
LB40 5
LA45 4
LA36 4
LB33 5
C5L 4
169 5
M3s 6
C5 5
AMs 4
ANs 4
C2 3

These parts could be RF transistors, diodes or MMICs.

The most likely suppliers of these parts are Panasonic, NEC, Toshiba, Sanyo, HP, Mitsubishi, Philips and Siemens. Unfortunately, I don't have catalogs for some of these suppliers.

I would appreciate any help you can give me.

Thanks,

Jean-Guy Michaud, VE3SKJ

Ok, these measured resistances don't make sense. Are you
perhaps measuring through an in-rush limiter? A filament's cold
resistance is always lower than its hot resistance. Since you're
seeing a resistance of 0.01 ohm with 30 amps through the filament
and 0.5 ohm with an ohmmeter on the cold filament, there must
be something else in the circuit besides just the filament. Or
your low ohms measuring equipment is in error. The latter is
a distinct possibility.

You don't tell us the tube type, but the rule of thumb is that you
need a watt of filament power for every 5 to 10 ma of plate current.
At the 100 kW level, if we assume a plate voltage of 12 kV, the
plate current needs to be in excess of 8 amps. That indicates
you need at least 800 watts of filament power.

So if the tube uses a 6.0 volt operating filament voltage, and needs
800 watts for the filament, the filament hot resistance should be about
0.046 ohm. At 0.3 volts and 30 amps, you're only heating it with 9 watts,
so the filament under test conditions is *still cold* compared to
design operating conditions, which should be a filament temperature
of about 1900 degrees Celsus. Thus the 0.01 ohm is a cold resistance
number. Now that makes sense.

I'd be very dubious of your low ohms measurements. Ordinary VOMs
are not trustworthy at such low ohms values. The room temperature
resistance of this filament is certainly less than 0.01 ohm.

it was perhaps decades ago, when everybody received USB, with
audio RTTY signals 2125/2295, but with the normal standard
1275/1445 the 1445Hz is MARK using LSB transmitter.

Unfortunately many amateurs mix up which sideband they intend to
use, some believe it is USB, some LSB, and quote some SSB
frequency for RTTY operation. For packet it is not important to
know which tone is mark/space. But it is sometimes difficult to
find a transmitter when you believe it is claimed a frequency
using LSB receiver, when it was USB.

Why not use the commercial method of center frequency, plus
minus shift (100Hz/85Hz) for either RTTY and utility monitoring,
and leave it to everybody else to decide how to tune using IARU
or ARRL AFSK tone standards on LSB/USB, or is it just too
complicated for the appliance operators of today?

I was once blamed for IARU region 1 adopting the European AFSK
RTTY tones, and I am pleased that they decided to use the best
standard.

1611. MC1350 ICs

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-14 00:00:00 UTC
From: Rich Griffiths <richg@one.net>
Message-ID: <34E5BBAC.6D4CD6A1@one.net>
Source record: 86249

Thanks to all for the advice on MC1350s. I also received an email directly from
Brad (WB9WHI) suggesting that I use double-sided board. He must be psychic.
This is generation 2 of the IF amps. I built all the first-generation circuits of the
receiver on double-sided board, so I had none left when I began the second
generation.

I'll check out the various comments this weekend and let you all know what
I find.

Thanks again.

One of the manufacturers (I believe it was Ford) issued a technical
bulletin regarding RFI. It involved a fuel pump fix and was recommended
to be done only by the dealer. So, I'd try contacting a local Ford
dealer and ask about RFI.

My usual supplier, Maplin, have a choice of 3 Vernier dials, with 6.3 mm shaft; however these are said to be "equivalent to" quarter inch. Personally I've never come across any other shaft size; and I've been noticing since 1947.

www.maplin.co.uk if you wish to ask direct. They are not cheap; but as suppliers I find them reliable and helpful.

I wish you had not said that you were making a 100kW amplifier,
because that suggests that you very confused - especially when we try
to figure out your filament measurements.

>When the filament is power on, its voltage and current is 0.3V/30A
>and power is off, the resistance of it is 2 ohm.(filament is warmed
>condition)

These measurements seem to be totally inconsistent. The power on
condition, if accurate, would indicate 9 watts of filament power.
Rather weak filament for a tube that is going to handle 100kW, don't
you think?

0.3v divided by 30 amps is only .01 ohms. When filaments cool down,
their resistance goes down - not up. Your filament cools down with a
higher resistance than it has when hot. Nothing about what you are
telling us makes any sense at all. Get your story straight and come
back when you have accurate measurements and a credible story.

>Then how do the voltage and current of the filament become 0.3V/30A at 2

The foc'sle is a storage or berthing area towards the bow of the
ship. It's the worst possible area to live, for the motion is
quite violent. Read Dana's "Two Years Before The Mast" to get
a better idea of shipboard living conditions (in that region
of the vessel).

Hi Rich,

I've been looking for 8122 tubes for my old National rig.

Do you have some that you would sell or swap for 4CX250's?

I have some good articles from ARRL handbooks on high power VHF amps
using the 4CX250, but I've never seen any homebrew articles or
commercial companies other than National use the 8122 back in the 1970's.

A few posting on the ham newsgroups suggest that they are very fragile
mechanically as RCA built them less ruggedly than the Eimacs.

DKTAYLOR (DKTAYLOR@NOSPAMprodigy.net) wrote:
: Looking for article or info on building a small 1-10 watt swr
: bridge/power meter.

The classic bridge circuit requires 3 resistors, plus a measuring circuit, typically a diode and an RC filter to which you connect a meter.

```
input o----+-----------+
< <
R1 > > R3
< <
> >
+--|>|-+-||-+------o output
< |
> +-/\/\/-+----o
R2 < R4 | meter
> === o
| | |
--- --- ---
/// /// ///
```

If R1 = R2 and R3 = desired impedance (usually 52 ohms), the voltage measured by the meter will be zero when the actual load impedance is the desired value. R4 is typically several thousand ohms, just to isolate the meter.

This circuit is obviously very simple. The major limitation of such a simple circuit is that it dissipates power in R3 which could otherwise go into the load, and it won't handle very much power. The first problem is overcome by just switching the bridge in only when you are tuning up. The second is not a problem if you are running QRP.

With a little bit of switching and the right choice of resistor values you can modify such a circuit to serve as a combination of QRP dummy load, SWR indicator, and output r.f. voltmeter. I once wrote a description of such a circuit for QST's Hints and Kinks column; it was reprinted a couple of times in various ARRL publications. If you write me I can try to find it for you.

Sorry, I almost missed this post. That's not a home page. It's Steve's E-mail address. Send him a note and ask for what you want. He's most accomodating, and probably has it already available. He just finished a design with the surface mount 98XX and has it up and running if you don't need the capabilities of the 7008. Also has the advantage of a 100 MHz clock, so it'll give you pretty close to 50 MHz operation.

Again, ...

Source record: 86141

Ford makes a filter for the electric fuel pump. There is a TSB (Technical Service Bulletin) on it, covers all fuel injected Fords. The filter requires that it be put in the gas tank next to the pump. It's a pain but I dropped the tank on my Bronco and it made a world of difference.

From: Rich Griffiths <richg@one.net>
Message-ID: <34E72F43.42FAD8F3@one.net>
Source record: 86142

Thanks again to all those who responded to my question about the stability
vs. gain of MC1350s. Here's how things turned out.

Two methods tamed the 1650 kHz amp. One was using double-sided board
(my thanks to Brad). The other was establishing a Zin x Zout impedance
product of 3,300,000 (thanks to Ed).

I know I also need lower ESR capacitors in several stages of this receiver,
but I'm out of good caps and am trying to hold off until a couple of
(Coming Real Soon Now) hamfests.

Hello Jeff,

I'm perfectly aware of what the foc'sle is, having spent some time on
sailboats as well as 41/2 yrs in the U. S. Navy. I don't understand
what your point is. My discussion refers to the meaning of the german
prefic "back" in the context of Backstag, which I believe is the
german for "forestay". Perhaps my meaning wasn't clear.

indeed they are 'fragile' - if this is the right word for it
we used 4x 8122 in 6 TX's for coast stations in this area. You must
check every valve for screen to controlgrid short circuit using a VOM,
up to 30% of the delivered goods showed this failure, and we could not
return them to the manufacturer! Similar experience applies for the
Danish manufacturer 'Sailor' which used 8122 in earlier shortwave
transmitter.

First time you test av valve be sure to run it with heater only for at
least one hour. But still some valves will have inter-electrode
short-circuit during first tests, so it is indeed a time-consuming
affair to find 4 valves to use in each transmitter.
It is important to use some grid bias circuit which will immediately
switch off the transmitter when screen-control grid shortcircuit occur,
or at least use some low resistance back-up negative grid voltage in
parallell with the variable, 18V transformer with 1N4007 diode, 1000uF
filter capacitor and a second 1N4007 gate diode (normally biassed off)
is a suggestion for secondary bias voltage to avoid screen voltage go

into the bias of the parallell valves (it is bad enough to ruin one valve!)

adding small resistance (10-47 ohm) in series with input/output of
active device (IC, transistor) usually improves stability (or removes
spurious oscillation)

It's some sort of rf module made by motorola, about 1"x.5" and has 5 holes for some sort of pin like connectors. The numbers on the module are:

NDL6942A
M77D12 B
8529 A4 MAL

The connections are as follows:
Pin: 1 - input (???16 vrf???)
2 - 12 to 15 VDC
3 - choke to b+
4 - Gnd
5 - Rf out

Motorolas web site is of no help. Does anybody have any specs on this module??

Thanks for your time,

Source record: 86157

You could drop the TX power to around 10 mW and use the '2510
to drive a 2 meter transverter. That's simple enough.

Of course, if you've fixed your '2510 for extra frequencies, you'll
find that it's pretty lonely on 142 MHz.

Don't even try to put a 144-148 MHz mod inside the '2510 box.
Buy a 2 meter FM rig instead.

Here's a good one. Get a 110VAC relay, wire it so that when you apply 110 to it the contacts open and then when the contacts close it opens the circuit to the coil again. What this self on/off action does when you use 110vac, and a long wire hooked to the contacts, radiates a hash sound that wipes out ALL receiving on your block. Just be careful with the 110VAC. You have to use it to really radiate this hash. And be careful. Some CBers are very nasty folks and might DF you. Get the neighborhood to sign a petition. Have people go in groups to this person's house complaining. Maybe they will get the picture. Gud luck

In article <34e5ab54.4766110@news.sol.no>, LS50@RV12P2001.nil (J M Nï¿½ding) writes:

>it was perhaps decades ago, when everybody received USB, with audio RTTY
>signals 2125/2295, but with the normal standard 1275/1445 the 1445Hz is MARK
>using LSB transmitter.

The PK-232, arguably the model T of TNCs, uses these tones. Plus, they are conviniently close to the upper audio cutoff freq of most simple SSB equipment, so AFSK harmonics are mostly scraped off even without a narrow filter on TX. On the other hand, an audio filter is easier to design at lower freqs than higher ones. Narrow bandwidth is attainable with lower Q since Q is related to the ratio of center freq to bandwidth. Specifically, narrow bandwidth op-amp passband filters work much better at a CF of 600 or 700 Hz than a CF of 2210.

Basically, it just doesn't matter except that you must use tone freqs that your station can use, and it is easier to use the same AFSK tones on TX as the ones you receive so you don't have to fiddle with split freq operation or using a lot of RIT. With most TNCs, the machine expects to see a particular freq for mark and space, and this is not front-panel or software adjustable except that you can usually invert the tones to allow using the "wrong" sideband. With a program like Hamcomm and the op-amp comparator type interface, you can set whatever tone freq you like, and so you only need to ensure that the signal falls in the passband.

I say again... official pubs list by the MARK freq, So if these government publications are your reference, your tuned freq will be listed freq + or - (depending on which sideband) the MARK tone your equipment is capable of using.

From a practical standpoint, just get in the ballpark and rock the tuning until you have the both tones clearly audible, then set the center freq or mark freq control for best print, reversing mark/space as necessary. If you cannot adjust the tone audio freq on the interface or in the software, you must fine-tune with the rig's tuning knob for best print as with the ubiquitous PK-232, and use only filtering that will pass the tones at that freq. To schedule automatic reception later on, make a note of the freq you tuned to and use that. We can trade opinions and observations all we want, but in the final analysis you can use mark, center freq, or even space to determine tuned freq offset or vice versa.

My suggestion for an unambiguous standard? This method is universally applicable to all setups, whether FSK, AFSK, USB, LSB, reversing/non-reversible, low/high audio passband, etc. When exchanging freq info, refer to both the MARK and SPACE actuall RF freqs. For example: if I

transmit with a tuned freq of 14081 indicated on the LCD of my HF rig on USB using Hamcomm set up for Reverse tones and a center freq of 2210, I would say my freq is 14083295, and for brevity I could just say 83295 if it is understood I am on 20 meters. For more accuracy I could also give the SPACE freq if this is not inderstood to be 170 Hz below the MARK, i.e. "83295/83125". Now, no matter what type of equipment you have, you can find me spot-on, first try. Let's say you have a reciever with a 500 Hz filter having a center freq of 750 Hz... You will want your center frequency to be within about 50 Hz of that. Let's say you want to use 750 on the nose, and USB mode. I don't know what sort of gear you have, but I told you to meet me on 83295 RTTY 20M". Your CF is 750, therefore your MARK audio freq as recieved will be 835 Hz. You will tune 835 Hz lower than the MARK radiated freq to get the 835 Hz audio tone. This gives you a tuned freq of 14,824.6 KHz and Reverse setting on the tones. No matter what hardware restrictions either of us have, we speak a common language regarding how to find one another on the air. I can also use this method regardless of hardware to tell you about a RTTY news transmission on a particular freq, and even if we use different methods of tuning, or even different sidebands, You will know where to set your receiver.

person's house complaining. Maybe they will get the picture.
>Gud luck

Pretty good suggestion, except you will be causing interference to a lot of other people, some of whom are not even aware of the problem with the CBer. If I suddenly heard a new noise like that, I would go looking for it, and I might be a bit irate about it if I found out it was intentional, even though your reason is one with which I would sympathize. The RF source should not interfere with other hams, TV viewers, or even other innocent CBers who operate legally and considerately. It should be something small and local, preferably highly directional. Automatic operation would be a plus, too.

I envision a very directional antenna pointed at the offender's house feeding a receiver tuned to her usual freq. Use the squelch or AGC voltage to turn on a voice keyer circuit on RECORD mode, and then play it right back to her over another transmitter when she stops transmitting. That will drive her up a wall! A scanner for the receiver will keep her from "getting away" with a QSY, though this will increae the risk of interfering with other CBers. This setup should be good for a couple of days' fun and games, before she gets help and starts trying to find the person echoing her transmissions.

When things get hot, you WILL have to shut down or risk getting into as much trouble as SHE deserves, so watch her closely, and shut down for a few days if necessary, or give the setup to your neighbors to pass around and play with, advising them to be careful. I bet you're not the only one who is getting his bowels in an uproar about this CB broad.

Now go ahead, Drew; tell me that this is wrong, and that these poor people in the neigborhiid just have to bend over and take it from this broad. I bet YOU wouldn't even operate in the inconsiderate manner that she does, and I bet you would be doing far nastier stuff to her than what we are discussing if she was messing up YOUR TV reception and wouldn't listen to YOU tell her that her use of amp and "Pawhr Maahk" are illegal, technically unsound, and inconsiderate. I included this last paragraph after reading my reply and thinking that this is just the kind of post you like to flame, so consider this last paragraph a pre-emptive rebuttal. EODFM

Looks like a little QRN happened somewhere in the path. That paragraph
should read:

The results from the equations, from EZNEC (or any other NEC-2 based
program), and from current magnitude and phase measurements I've made
with actual antenna arrays all agree. Perhaps you will, too, after you've
looked this, the article, and the Antenna Book chapter over.

>Is it possible to build a balun with an arbitrary impedance ratio ?

No. To be effective, a balun has to present a common-mode impedance many times the load impedance. Achieving impedances a lot more than several times 50 ohms at HF or above is difficult. Also, any transformer (which an impedance-transforming balun is or includes) has a winding connected from one side of the circuit to the other. The impedance of this winding has to be much higher than the circuit impedance, or it will disturb the circuit operation. It's difficult to make winding impedances much greater than several times 50 ohms, so it's hard to effectively transform to high impedances.

The problems in getting transformations to very low impedances are different, but I don't think there's much problem in going to values of 10 ohms or even less. I'm sure others have more experience than I do at transforming to very low values.

Hi Chip,

it is not too complicated to receive the pictures from the low orbiting (700 km) NOAA satellites transmitted at frequencies around 137 MHz.

I've used a scanner, the short whip antenna which came with the scanner and a uC controlled fax converter (the simple one op amp fax converter described in the JVFAX or HAMCOM software docu won't do) and the JVFAX software.

A discone antenna instead of the whip should give better results. Best results are obtained with circular polarized cross dipole antennas and a selective pre amplifier.

There are also quite some fax decoders which use the soundcard. I have tested FTV (MSDOS, shareware). For a list of other programs have a look at http://www.muenster.de/~welp.

If you want to receive the signals of the fixed position METEOSAT satellites you need a high gain yagi or dish antenna and a low noise down converter.

Source record: 86161

I tried this once before several years ago, and sorta forgot exactly
how I did it. From what I remember it was sort of successfull, but I
had to fill in missing traces on the board.

I am trying to refresh my memory:

I made a PC board using the Protel freeware design s/w to make the
layout. I then printed the layout on a Laser printer. I then taped it
to a piece of circuit board. I then used a houshold iron to heat the paper and

adhere the trace from the paper to the circuit board. I don't remember how
hot I made the iron. I also don't remember exactly how I removed the paper
and left the trace on the board. Vaguely, I seem to remember that I used
some sort of clorox-water solution to soak the board in.
The mixture I am not sure about. Anyone remember the details?

Perhaps you really aren't interested in a specific impedance transformation. Perhaps what you want is a simple common mode choke, which can be made by coiling up a length of coax or by putting ferrite beads on a coax.

What is your actual application?

The Boneyard Bluebook is BACK (well kinda!)

Are you curious about the value of your boatanchors?

Not sure what you should pay for a KWM-2 this year?

Try consulting the BONEYARD BLUEBOOK available on-line at:

http://www.mnsinc.com/bry/ham/boneyard.htm

It's just getting going! I am going to add a lot more soon.

If you see any BA brands that I misse dout, please let me know!

I am sorry I confused you.
My amplifier is 100kW and nomial voltage and current is 9V/280A.
During the filament test(9V/280A), filament power was suddenly turn off, we don't know that reason. emergency occurred....
So we measured the filament resistance with a tester under the condition that the filament was warm due to residual heat. The resistance is 2 ohm...
So we reprovide the filament power to test the filament with small voltage(0.3 V) and the current is 30A.....it is very difficult probelm that 0.3/30A flow to 2 ohm resistor....
After one hours later, the filament is sufficient cooled anf the resistance came bact to 0.3 ohm..... that's all.....
Would you explain this phenomina?????

I've never tried it with paper, but here is the method I use.
I use transparency film for plain paper copiers. This is just the regular clear transparencies that you can purchase from any stationary store. I print my layout onto the transparency, then iron onto a piece of copper clad board that has been cleaned very well with super fine stell wool. I use just a cheapie household iron set for maximum temperature, and hold the iron on the layout "with no movement", for 1 minute, 15 seconds. Also, make sure the copper board is a little bit bigger than the transparency layout before you start. Say, 1/4 inch larger around the edges. If the transparency hangs over the edge of the copper board, you will lose more trace material as well. I apply slight pressure to the work area. Let the board cool off completely before peeling off the transparency. If the board isn't completely cooled to room temperature, you will lose some of the traces. You may have to touch up the odd trace slightly. This method works out very well for me, and no mess!
Hope this helps, 73, AL, VE6BPR.....sk

> Two applications for high power on VHF occur to me immediately, broadcast >FM and broadcast TV.

I can agree with that. One would hope that anyone trying to design such equipment wouldn't have to be asking us about filaments! :-)

It's also possible the power is needed for some scientific experiments, where it won't be unleashed on an unsuspecting public. In that case, I can understand someone getting into something they didn't know much about...

My suggestion to the original poster is to find the official data sheets and all the application notes you can get your hands on for the tube you want to use, and study them all thoroughly until you really understand them. If you are having trouble just getting the filament lit, I suspect you are going to have a lot bigger (and possibly much more spectacular) problems later on. (It can be interesting, but usually not very pleasant, to watch the envelope of an expensive tube literally melt.)

Cheers,
Tom

My son wants to receive Satelite weather picutres. Any Ideas on the
cheapes
>way to do this?

Chip

Download JVFAX. I think 7.1 is the current version. Build a Hamcomm-type interface, which will cost around $15 for the handful of parts, perfboard, connectors, and cable. The program is shareware, so if you can't get it to work on your son's computer, you aren't out very much. The program is fully-functioning as far as I know. Try receiving HF faxes first, before going for the pics directly from the sats. Several coast stations re-transmit the sat shots, along with weather charts, etc. You will need a shortwave receiver that can receive SSB fairly well. I have used a DX-390 and a YB-400, but performance is a bit underwhelming with these rather lackluster sets. A better receiver gets better pictures, all other things being equal.

There is a lot of satellite activity around (I think) 136-137 MHz... I believe these are the LEOS birds, and they move across the sky rather quickly, so you will want some satellite tracking software. There are commercially available receivers for these freqs, as well as high performance antennas and pre-amps. For the GEOS sats, which are in geostationary orbits, you will need a downconverter and more sophisticated antenna and pre-amp.

My suggestion is to check out HF first... even HF is not a no-brainer, and there are a lot of technical challenges for the newbie involved with pulling faxes, but if your son already has a good shortwave receiver or ham transceiver, you can get him started pretty cheap. Then if he shows enough interest to come up with a couple hundred bucks for the gear, help him get started with working the birds.

In addition to weather faxes, the JVFAX/HAMCOMM setup can also send and receive amateur faxes and slow-scan TV, and with the Hamcomm software the same hardware can copy or send CW, RTTY, AMTOR, and other digital modes used by hams, military, and commercial stations.

The most likely problem you will have with JVFAX is if your computer clock is jittery as mine is on my new computer, faxes will come out awful. The only remedy I know of is to buy a TNC (terminal node controller... this is a "magic box" that does all the decoding before it even gets to the computer) and use a fax program meant to be used with a TNC, or get another computer.

The documentation with the program shows how to build a basic version of the Hamcomm circuit. In its simplest receive-only form, it is nothing but an op-amp IC, a couple of resistors, 4 diodes, and 3 or 4 capacitors. It is a real no-brainer to build in this form. The device gets its power right from the computer's serial port... but I have had trouble and other hams have had trouble with newer machines needing higher signal levels than the interface can provide, and serial ports not being able to provide sufficient current to operate the device. I use two 110-12V transformers with the primaries in parallel and the rectified and filtered outputs in series, using the junction of the outputs as ground, so I have + and - 12 VDC (actually closer to 18V) to run the op-amp. This makes the device run great on my new notebook, though it is a lot more bulky than the matchbox-sized units I am used to building and using.

There is an outfit called Softare Systems Consulting in San Clemente CA that sells a fairly nice ready-built unit that does pretty much what the hamcomm device does, and software to go with it. I think the whole kit for receive-only goes for around a hundred bucks. The program is not as versatile as JVFAX and Hamcomm, but it is a little easier for a first time user to get it running. The Baycom BPM-2 is a similar device that works on a somewhat different principle, ad sells for around $60 for the whole setup, receive and transmit. I am not familiar with the software, though. I used their first generation unit for packet only a few years ago and found the software to be a bit uninspired, especially the documentation.. my judgement may have been colored by the fact that I only do HF, and I found out to my chagrin that there is very little live, ham to ham traffic on HF Packet, so basically I had nobody to talk to with that device, and in the author's defense I should point out that English is not his usual language. The Baycom system is very popular in Europe and with portable Packet operators here in the states.

Software Systems Consultants sells stuff off-the-shelf and ready-built for actual satellite reception. I think you can put together a package for the LEOS sats for aroung $500, not counting computer. I imagine anything 386 or better would do fine, and I guess you already have one. If you run across an old 386 or 486 box somewhere, though, snap it up... your son may want to keep it for a dedicated radiocommunications terminal.

Robert,
the word back for the forcastle is also known in germany. BTW the backstag
is not the forestay (Vorstag in german). If a boat has backstags it has two
of them. They go from the mast backwards to either side of the boat, while
only on one side, the leffward, is tight.
I hope this description helps to locate that stay.

Andre

I met someone who had one; he worked at the Alternative Energy Site at Mchynlleth. They are on the web - use Altavista maybe.

It's generally believed that it's more feasible to carry round the batteries and recharge them when back at base. That's what the military do. But technologies keep changing; I'd back (no pun) ANY magnet-coil alternator, followed by a capacitor-rectifier ladder so that a constant voltage gets charged whether the movement is much or litte. I've wondered about roping it to treetops!

Me again - I'm thinking along the same lines as Tom. For 100 kW out you would need at least 200 kW in. So your supply transformers would be the size of a housing estate substation. And you would need the sole use of a housing estate sub station. That's why I wonder whether there's been a misprint somewhere.

There may be some confusion between the function of a beacon and a tracker. A beacon cannot be used as a tracker. A beacon is a transmitter which transmits to a prearranged scedule, or maybe continuously, usually at low power and usually to help people who are studying or experimenting with propagation. To use a beacon you need a receiver.

A tracker is a receiver with a special aerial which helps you find which direction the signal is coming from.

To track, say, a wild animal you would use both: the beacon would accompany the animal, and the tracker would be carried by the person studying the animal.

It might be quicker to get help if you say exactly what you want to achieve.

wrote:
>I am sorry I confused you.
>My amplifier is 100kW and nomial voltage and current is 9V/280A.

Ah, this is better. Normal operating filament power is 2520 watts. That
sounds right. And that gives a filament hot resistance of 0.032 ohm.
That sounds about right too.

>During the filament test(9V/280A), filament power was suddenly turn off, we
>don't know that reason. emergency occurred....

Ok, you had a filament circuit fault. Do you mean that the filament current
went to zero, or do you mean that the filament power supply tripped out?
Those are very different fault conditions. If filament current went to zero
but the filament voltage was still present, then you had an open in the
filament circuit somewhere (likely candidate is at the tube external
connections). If the filament supply tripped out, you likely had a short
somewhere (likely candidate inside the tube).

>So we measured the filament resistance with a tester under the condition that
>the filament was warm due to residual heat. The resistance is 2 ohm...

The operating temperature of the filament is about 1900 degrees Celsus.
It will *very* quickly cool from that temperature when current is interrupted.
If you measured after only 10 seconds, you were not measuring hot filament
resistance. But you may have been measuring *contact* resistance in the
external filament connections to the tube. Inadequate cooling here could
have caused the contacts to expand and not provide good electrical contact
to the tube filament. This may have been the cause of your fault.

>So we reprovide the filament power to test the filament with small
>voltage(0.3 V) and the current is 30A.....it is very difficult probelm that
>0.3/30A flow to 2 ohm resistor....

At that voltage and current, you are only supplying 9 watts of power to the
filament. That filament is *cold* under that condition. And a cold resistance
of 0.01 ohm sounds reasonable.

>After one hours later, the filament is sufficient cooled anf the resistance
>came bact to 0.3 ohm..... that's all.....
>Would you explain this phenomina?????

As noted, the filament should have been essentially cold after only a
few seconds with no power. However, the *tube* may have still been
hot, and the tube seals and external connections may have still been
hot. That would in turn make the filament contacts hot, and keep them

expanded so that poor electrical contact still existed.

I think you'll find that the problem is due to poor contact with the external filament connections of the tube under power due to heating of the contacts. This is usually an indication of inadequate cooling. If the tube socket and seals are forced air cooled, make sure that sufficient air volume is being supplied. If the tube is water cooled, the socket may still require forced air cooling. This must always be present any time the tube is powered, and has to continue for a specified time after power is removed, or contact damage can occur. Examine the filament contacts for any discoloration which might indicate they have overheated. If you see any sign, then redouble your efforts to determine the cooling fault.

I have an Icom 2410H dual band mobile unit. I want to wire a second microphone up for this radio to use upstairs. (The Ham Shack is downstairs and I hate to run downstairs to answer the radio.) I have a remote speaker installed upstairs... now I want to get a remote microphone upstairs.

I have created a junction box for the 8 PIN MIC port. I currently run the HM-56A microphone that came with the 2410H through this junction box. (IE. The junction box is plugged into the radio's MIC port and the two microphones will be plugged into the junction box.)

I could just buy another HM-56A MIC but I'd rather find out how to wire a simple handi-talki style microphone to work with my junction box.

Does anyone have a schematic on how to wire a simple Radio Shack style handi-talki microphone to work on a Icom 2410h MIC port?

Or does anyone have a wiring schematic to run a TNC through the MIC port of an Icom 2410H?

Does anyone have any knolage of the New RF ID transponders that are in use now??? I am trying to get some info on how they are used with no batteries inside. I think they use some sort of pulsed electromagnetic frequency to punp up a small capacitor and once the cap has enough energy, it sends a radio signal back to the reciever. Can anyone shed some light on this subject for me and let me know if I am right. I have been experimenting with some coils of magnet wire and a smmaller coil hooked to a capacitor and I just cant seem to transmitt much energy at any kind of distance. Im thinking that the system must be matched somehow at a resonant freq. so it can transmitt power more than a few centimeteres.
Please reply to ats@penet if you can help explain how to do this.

Thanks in advance!!!

No! No! No!

Hamcomm will *not* work with satellite imagery. How can it? Hamcomm is a zero-crossing detector, and the satellite APT subcarrier is amplitude modulated...

The slickest way these days is to use a program that talks to your soundcard, like WXsat. I geeked out and wrote my own - pretty simple, actually. My current version uses quadrature AM detection and works well.

If you really insist on building hardware, I've tried WB8DQT's interface (Weather Satellite Handbook), with minor modifications, with JVFax.

The key thing was to hook up the ADC chip so that it clocks itself (grab a copy of the datasheet for details), and then apply all 8 bits of output to the relevant data bits on the PC parallel port. You may need to run the CMOS setup program to enable input on the parallel ports ("bi-directional"). The tell JVfax it's using 8 bit parallel input.

Frequencies: 137.5 MHz (NOAA-12), 137.62 MHz, (NOAA-14) and 137.85 MHz (Meteor 3-5). You know you've got good signals when you can hear the sync pulses - the "tick tock" effect on the NOAA satellites, and the "snap" on Meteor.

It's exceedingly difficult to measure such a low resistance accurately. The tester registers the resistance between the points where its leads touch the item being tested - or maybe even including its own leads. I think some of the inconsistency arises here.

The jury's still out on whether you can convert a cell phone
to 902. What brand is it? What's the chip set for frequency
control? I've heard both sides of the argument -- "can't be done"
and "it's simple, we did fifty of 'em."

You probably know that cell phones (AMPS) have a funny wide split
between transmit and receive that straddles the 902 ham band.
With a little tweaking, both the RX and TX sides should (in theory)
come onto the ham bands. The problem -- frequency control, and
displaying the frequency. At the very least, you can carve
the PA out of the cell phone and have a cheap watt or two at 902.

If _ANYBODY_ has successfully converted a cell phone to 902,
PLEASE PLEASE post your information! This conversion could be
what we need to save 902 from predatory commercial interests --
plus, cell phones now represent the single most available
fodder for conversion we hams now have. Cell phones represent the
ARC-5 of the next century.

Although I'm no big fan of the ARRL and especially of QST's
editorial policies, you could make a BIG name for yourself
if you authored a definitive article on cell phone conversions
and got one of the big magazines to run it. Wayne Green would
sure be proud....

As someone has already pointed out, there are two opposing groups about whether this can be done.

I don't know which is the truth, but there are other things to do with an old cell phone before throwing it out.

Not all Command Sets were simply converted to amateur use. They were often treated as a source of high grade components to use in other projects rather than rework the whole thing.

Likewise, cell phones can be seen as a source of parts. I picked up an old brick type transportable (I guess that's the proper word for it) at a church rummage sale for fifty cents. It included a gel cell battery that was worth far more than that fifty cents, so right away I was ahead.

Opening it up, there was a IF module that took a signal from the low VHF range, and converted it to 455KHz where it went to an FM detector. That would make a good start for a wide coverage FM receiver using a tv front end. Or use the filter as a roofing filter, and the crystal to convert to 455KHz, and add a narrow band 455KHz filter and you've got the makings of a high grade general coverage receiver.

There was also a TCXO, which if it's any good, would make a good reference oscillator.

There are a couple of what must be prescalers. Provided I can find information on them, they would make a good start for a synthesizer in the VHF range, and it's easier using these at hand than order away for them.

Those were the items that stood out. The VCO's are there, though I can't think of much use for them right now other than for something in that range.

There are quite a few other parts in the thing, fairly common but still they are parts. This is old enough that the active devices are not SMD, which makes it easier for the homebrewer.

And certainly even if you can't do a simple converstion to the ham band, using the parts like the TCXO and IF module and VCO's and prescalers do provide for a good start for building something for the ham band.

Just a quick note.
Hamcom will work with the wx satellites, but you will need to add the simple circuit from the JVFAX diagrams directory using the 2206 chip. The circuit goes in the audio line ahead of the hamcom board. I used to use it here before the WXsat program was available. WXsat does a better job though, if a sound card is available.

Latest version of Morse Decoder MRP37[3] is officially released !

MRP37 is a software-based Morse decoder developed as an MS-DOS
application by Polar Electric Engineering. It uses the audio output of
your radio receiver connected to your computer's sound card to decode
the CW audio signal to ASCII text.
A comfortabe CW-send function is included!
Now you can have a QSO at CW speeds of 20 wpm or more and make even more
contacts during CW contests! And by careful listening, we think you'll
notice an improvement in your own code copying ability.

For more info and instant download and test of MRP37[3] go to
http://members.tripod.com/~PEeng/morse

For additional information send mailto: POLAR.Electric@cww.de

AM.

How about a regular airband scanner? Maybe one with a recorder output that closes a set of contacts whenever there is carrier present on whatever frequency it is tuned to. Maybe a timer circuit to automatically turn off the lights after a predetermined time so false triggers in this shared system would not burn his lights all day and all night...

Try the Radio Shack X-10 wireless remote control system.

> yeah, I have a cell phone waiting to be converted too!

The answer is that some phones can be converted, however I do believe
that it is an easy task. I have worked on three. The one that was
successful was a big black box of a phone from a company called KEA.
There were at least two others that I tried and found that they would
not move. There problem was that the PA would not shift up to 902 mc.
They rapidly felloff in power to the useless point.
Here are some hints as to how to approach the phones,
older seems better.
Bigger parts to work with.
Less custom chip sets.
Does the power amp shift to 902?
Fire up just the PA and see if 2 mw max gives
you a reasonable power out. (2-3 watts)
Get rid of the micro processor who can figure out all the code thats

wrong for amatuer use anyway.
I control the PLLs directly from a pc printer port. Each chip sets a bit different, but far easier to deal with then the cpu. After I figure out how to program the PLL I substitute a Basic stamp CPU. Works fine.
You must shift the unit to simplex operation.
Some of the VCOs make it some don't.
Lower the tuning cap across the resonator.
The sensitivty is not hot. Never needed it in Cell service.
Add a preamp.
Must add t/r switching.
On the KEA, it used motorola plls and one unit puts out 10 watts the second one puts out 6 watts. They are at the ragged edge of the PAs capability.

It would be much easier if we could build a split frequency repeater and reduce the amount of work required internally in the phones.

Source record: 86203

Hi Paul

I hadn't thought about PL control from a parallel printer port -- but it's an obvious solution. Do you have a specific reference book that got you started with using a parallel printer port to control a PLL? I've seen refreences to a couple of these books, but haven't actually checked any of them out.

Did you keep any kind of an engineering notebook when you did the conversions? (Yeah, I know, probably a dumb question.)

Having seen the inside of some of the newer cell phones (and I deal with the state of the art in my day job) I agree that the older and bigger the phone, the easier it is to modify/tinker with.

Lucky for us, a lot of these are coming up surplus or junk now.

If anybody has anything they'd like to share (but not necessarily on this newsgroup) it's OK to email me -- I'll pass along a summary of what I get -- at jstrohm@texas.net

I want to purchase a pair of 572B's amp tubes. New or good pulls OK.
Reasonable. Let me know what you have.

I agree completely. The cell phones are the ARC-5 of the 90s. Also,
consider the 900 MHz cordless phones. Analog versions are available
new for $50.

Anything can be done. Normal cell phones rx at 870-~880 and tx at 830-840 or there abouts.They have narrow filters because they are full duplex. As I say, anything can be done here are the challenges:

1. Retune the duplexer filters on TX and RX
2. Retune the RX front end
3. Get the RX vco to go up 30-40 mhz
4. Add another TX VCO so you can do a 12 or 25mhz split (all the cell phones I've seen only have one VCO.
5. Figure out how to bypass normal cellular data link protocol.
6. etc.etc

I've had much more luck converting Motorola commerical rigs. We are using MTX900's and they work very well, I hear MTX9000's also work but haven't tried those.

Many years ago, I built a DIGICOM>64 TNC. I have another application that could possibly make use of the same modem chip, only I can't remember what it was.

Can someone jog my memory ?

Thanks,

Mark VE6HVW

Simple, and inexensive RF switches can be made with a cheap set of walkie talkies, (even toy walkie talkies), an old CB Radios from a pawn shop, or dusted of from the trunk or your car. There are a number of RF products that can be converted for this project, easier than making one from scratch.

Say you have a pair of old CBs, ideally two that run on small batteries, and at least one of them has a earphone jack, others can be used, but, the ready made phone jack, makes it so much easier.

A low power opto-isolator could be connected to the earphone jack, and the other end can be hooked up to an appropriate relay. when a loud or sharp sound is transmitted on the appropriate channel. The device hooked up to the isolator/relay, is fired. this works great for time lapse photography, firing a flash, or triggering an alarm. Circuits from a series of very simple, and low cost books by Forrest Mimms, found at Radio Shack will have tons of information, you might find handy.

You meet all kinds of nuts on the internet, I don't know if your one, if you plan on blowing up an abortion clinic with this switch, go ahead and use this method. If you want to use if for peaceful, persuits it should be fine too, be aware, that all types of wideband RF noise could trigger your switch, prematurly. Thats is why it is a great switch. for those "Army of God" types out there.

1728. HV plate transformer question

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-02-16 00:00:00 UTC
From: Don <bjmcpher@usit.net>
Message-ID: <34E911A2.7C010167@usit.net>
Source record: 86211

Im considering trying to wind my own transformer. I have a torroidal variac rated 120v and 50 A. If I strip off the rotor and brushes, etc, Whats left is basically a large torroidal core with a heavy 120v winding. Since its taper wound, the current rating as a transformer primary would only be 25 A, But thats more than enough.
To wind the secondary, I figure I would need 20 or 22 ga. magnet wire to get about an amp of secondary current rating. I know I need to wind a few turns and make some measurements to determine how many turns it would take for a given voltage, say 1800v, then figure the dimensions and winding layer plan. I also know I'll have to run some very heavy wire from the fusebox since it will be a 120v transformer. The things I would like to know about concern the insulation scheme. I thought of using tefflon plumbing tape, but it seems too thin. All the other easily obtainable things I can think of seem to be either too bulky, not high enough puncture voltage, or dont take heat and environmental factors well.
If anyone has any ideas about how to go about insulating this, I would sure appreciate the help. Also does anyone know a cheap source for 20 ga magnet wire? The ones I know of like amidon are geared to small quantities so it would cost an arm and a leg. (I did see some very cheap surplus magnet wire in a catalog, but it was all 30 ga. and finer.) Any suggestions are appreciated, even if its to tell me that this is a hair brained idea!
Thanks

==========

Bud,

Look for an older ARRL FM & Repeater handbook many of them had the
details for home brew cavities, maybe the current isues of the ARRL
antenna book may have them.

I'm looking for a schematic for the Heath Ecucational Systems
Breadboard.
Model ET-3100.
This is a small console with a power supply, signal generator, two pots
and a small breadboard
area for prototyping circuits.
I'd like to soup it up a little. Schematic would help.
tnx, miker

P.S. The impedance of 0.3 v / 280 amps (0.001 ohms) is not an unreasonable cold impedance for a filament that is 0.03 ohms hot. The only thing wrong with any of his report is the 2 ohms reading - that's a real red herring.

P.S.S. Got all my numbers mixed up on that one. I should have said: The impedance of 0.3 v / 30 amps (0.01 ohms) is not an unreasonable cold impedance for a filament that is 0.03 ohms hot.

Santiago 17 February, 1998

I am asking for help on repairing a power supply.

I regulate the voltage with the 723 IC and I got followings problems:

how could one protect the supply against short-circuit(I need 13.8 / 18A)?

I take 2N3055 as series pass transistors 4, but I don't know how to match
the transistors. Does somebody know about what type/ Trademark of 3055 are
the best

I 'll be very thankfull for a really good answer

>Is it possible to build a balun with an arbitrary impedance ratio ?

Arbitrary? No. But there is no need to stop at simple ratios.

In the February 1994 issue of RF Design, there was an interesting
article by Donald McClure about equal delay transformers having all
sorts of funny ratios, using clever combinations of series and
parallel pieces of coax.

Even though you may not get the exact ratio you want, you can usually
find one which is close enough.
